

BINAY - Lighting Up The Future

BINAY LED-based HIGH, MEDIUM AND LOW Intensity Aviation Obstruction Light Beacons

As per International Civil Aviation Organisation (ICAO) requirements Available in Low Intensity, Medium Intensity and High Intensity versions (as per International Civil Aviation Organization guidelines), BINAY's patented LED Aviation Lights come with 5-year/3-year warranties

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick Installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

laser system available today. It can add a lot to smartphones, 3D video games and self-driving cars.

According to the researchers, the technology can let a self-driving car spot a roadblock from half a block away or allow you to answer your phone from across a room. It is a 3D imaging technology based on LIDAR (Light RADAR) system, which sends a feedback using a light-emitting laser. It is actually quite good, since the system isn't bulky or huge at all.

A class of lasers known as MEMS tunable VCSELs have been used to create the technology. The laser could be what Google needs in order to perfect its self-driving cars and could also add a lot to the existing smartphone technologies that we have.

This 3D printer creates fruits in custom taste, texture, size

Now we have a 3D fruit printer that can print the real edible fruits. Cambridge, UK-based design studio cum innovation lab, Dovetailed, has made this revolutionary 3D printer. The makers of the printer have worked on crafting physical and

3D fruits (Courtesy: www.crazyengineers.com)

digital experiences, which change the behaviour.

The innovators have used the technique of molecular-gastronomy, called spherification, to make the 3D printing machine

combine individual liquid droplets with different flavours into a desired shape of the fruit, only in a few seconds.

The team behind the 3D printer opines that this 3D printer could be a great help for the chefs and foodies. No prerequisites are required in using this 3D printer. So anyone can use it, even with no knowledge of the molecular-gastronomy technique or cooking. The printer prints fresh and organic 3D fruits.

The printer lets you have the liberty of creating your own custom-designed fruits. It means that you can make your own fruits that haven't existed before, in shapes, sizes, tastes and textures!

This augmented reality helmet is truly a guardian

A new Android-powered helmet for motorcyclists was unveiled by a company called Fusar Technologies at the Augmented World Expo 2014. The helmet, known as Guardian, is fitted with an Android board and two wide-angle cameras. In addition, it also holds part of the Epson Moverio Android-powered head-mounted display.

"It is a fully integrated and connected device that motorcyclists can wear, that allows them to have a full cognitive awareness of what's going on around them," says Ryan Shearman, founder and CEO of Fusar Technologies. The
