

Some of these also come with wireless connectivity, such as Bluetooth. Using them you can view the signals remotely within a defined distance. There are a few that you can connect to your Android device and view the signals wirelessly. Table III shows some of the pocket-size oscilloscopes from different vendors.

DIY-type oscilloscopes

Lot of designs are available on the Internet to build oscilloscopes yourself and use them for basic testing. In most cases, complete designs including schematic, layout and source code are available. Their performance, however, will depend on the quality and proper assembly of the components.

DIY-type oscilloscopes are mainly microcontroller based. The most popular microcontrollers for oscilloscopes belong to AVR and PIC series. Their frequency range also is not very high. Some of them display the

Model	Bandwidth	Sample rate	Website link
AVR DSO	10MHz	50MS/s	http://www.ulrichradig.de/home/index.php/avr/avr-dso
DSOA Mk3	5MHz	20MS/s	http://alternatezone.com/electronics/dsoamk3.htm
eOscope	20MHz	40MS/s	http://www.eosystems.ro/index.php/projects/eoscope
06201P	1MHz	5MS/s	http://www.jyetechn.com/Products/LcdScope/eDSO062.html
PIC12F675 Oscilloscope			http://www.semifluid.com/2006/01/31/pic12f675-oscilloscope/
PPMScope	500kHz	1MHz	http://jonw0224.tripod.com/ppmscope.html
SX28			http://www.sxlist.com/techref/ubicom/sxoscope/index.htm

signals on a computer monitor while others have integrated LCD displays. Those using computer monitor for display are more comfortable than those with integrated displays. Table IV shows some of the DIY-type oscilloscopes.

From all the above types and options, choose the one that suits your taste and requirements. All the

oscilloscopes offer reasonable quality, including the DIY ones. However, one from a reputed manufacturer is more likely to give accurate measurements and performance.

It is only the beginning; we are likely to see a lot of better and cheaper options in future. ●
