Suresh Kumar says, "Most regulations come through governmental organisations globally. However, there are certain segments like automotive, which have a consortium of expertise that bring forth some special standards. For example, Forbes, Clintwear and GM joined together and have come up with some standards for the automotive industry but then restricting myself to the consumer market, the products have to comply with the local government standards or international standards."

R&D Centres

Bengaluru has 43 per cent of R&D centres

compared to the labs abroad.

Lack of skilled manpower. Skilled manpower is somewhat related to the test facilities, as the skills are also required with the usage of the tools and facilities rather than just the implementation of the procedures. Vamshi Kandalla, global GM and VP, Granite River Labs says, "It is but obvious that an individual with strong knowledge in the certifications and test facilities in the country can operate as a consultant to a number of manufacturing industries and development centres."

No supportive policy for setting up labs. Although the government has come up with schemes to build a few labs in India, there is no conducive policy for someone setting up a testing lab. Peeyush Gupta, director, sales and marketing, UL says, "In India, setting up a laboratory involves high costs and advanced infrastructure development. In some cases, such as setting up

"UL is committed to working with manufacturers, industry associations and government bodies to accelerate adoption of safety standards and certification procedures. Our aim is to ensure that the consumer has access to high-quality products as a result of regulatory testing and standardisation of products and services." —Peeyush Gupta

"Overall impact of the government schemes and policies is not affecting the Indian industry but the R&D section of the industry" —P. Chow Reddy

a top-quality mobile testing laboratory or a wireless testing laboratory, the cost varies between 200 million and a billion rupees. Unfortunately, there are no existing regulatory policies or government schemes that support infrastructure development or incentivise quality facilities to address specific market regulations." Sometimes, it is difficult to set up a lab as the kind of infrastructure required for this is so immense.

From tens of millions of rupees, some can require ₹ 500 million investment. One is required to spend anywhere from ₹ 2000 million to ₹ 5000 million to set up a good-quality mobile testing lab or a wireless testing lab.

Lack of public private relationship. There are some private labs in India that are working in the field of testing since over 100 years in a global environment. They have a lot of knowledge and expertise for not only testing but also for standard-to-standard citing. Generally, the Indian government looks at these private labs only for innovation testing or infrastructure.

The government should open up in terms of policies and standards for private players. There is a need of firm commitment in terms of regulations,

Challenges to the industry are not few, but a better understanding between the government of India and the private testing labs can help eliminate the major challenges

Share Your Knowledge

If you are an expert in your field of electronics, why not share your knowledge with the world?

Electronics For You invites electronics professionals and industry experts to write articles on their area of expertise and interest from different perspectives

Some of the topics we want you to write about are:

- Photonics: Optics & Optoelectronics
- Automation
- Power Electronics
- Components
- Telecom

So if you have an interesting topic or original article to share, please let us know at efyeditorial@efyindia.com

We would love to hear your good ideas too!
