COMPONENTS

Nanopower sensor ICs

Digi-Key Corporation has just announced stock of Honeywell's new Nanopower line of magnetoresistive sensor ICs. The ICs respond to either a North or South pole applied in a direction parallel to the sensor.

The ICs use a very-low average current consumption and a push-pull output, which does not require a pull-up resistor, operating from a supply voltage as low as 1.65V. The SM351LT series is for applications requiring ultra-high magnetic sensitivity and a very-low current draw (360nA typical) while SM353LT series is for applications requiring very high magnetic sensitivity and a very-low current draw (310nA typical).

The devices are supplied in the sub-miniature SOT-23 surface mount package on tape and reel for use in automated pick-and-place component installation. The ICs reduce system cost and provide a durable alternative to reed switches in low-power battery applications, including industrial, medical, white goods and consumer electronics.

Low-voltage power MOSFETs

ON Semiconductor has introduced a family of six N-channel metal oxide semiconductor field effect transistors (MOSFETs).

The new NTMFS4Hxxx and NTTF-S4Hxxx series of MOSFETs are ideally suited as switching devices for a wide range of applications including server and networking equipment and high-power-density DC-DC converters, or to support synchronous rectification in point-of-load (PoL) modules. Versions of these MOSFETs are available with or without an integrated Schottky diode that can help engineers achieve even greater efficiency.

Best-in-class RDSon performance of 0.7 milliohms and low input capacitance of 3780pF ensure conduction, switching and driver losses are minimised. The MOSFETs offer improved thermal performance and low package resistance and inductance compared to existing devices.

Smart-Meter ICs

STMicroelectronics has introduced new smart-meter chips that enable utility companies to improve billing by measuring accurately down to extremely low power levels. Meters featuring ST's new STPM32, STPM33 and STPM34 ICs will help utilities minimise revenue losses

and ensure consistent billing for even the most frugal customers. Although existing meters are highly accurate at current levels, typically down to 50mA, errors at lower currents can bring about, in today's low-standby era, up to megawatt-hours of lost billings across a large customer base. The STPM3 devices prevent such losses by keeping the meter accuracy down to just a few milliamps, comparable to the current drawn by an LED television in standby.

These new chips also enable the development of more economical meters that help utilities reduce their operating costs. By performing power-quality calculations on-chip, including RMS voltage and current measurement, apparent-energy computation and under-voltage/over-voltage detection, the chips can offload the meter's host processor, thus simplifying software.

TOOLS & EQUIPMENT

3D printer

LBD Makers has launched two models of 3D printers, MY3D BOT and XTRON, which it claims to be fast, accurate and easy to use.

Both the models feature fused-deposition modeling technology, layer resolution up to 0.1mm, 0.4mm dia nozzle with 1.75mm dia input and multi-material (ABS/PLA) printing. MY3D BOT gives 100-micron accuracy and average speed of 55mm/second and 140mm/second travel. XTRON gives 50-micron accuracy and average speed of 65mm/second and 160mm/second travel. XTRON also has an LCD screen.

Solar micro inverter development kit

To ease designing of rapidly-growing solar-power applications, Texas Instruments (TI) announces its C2000 solar micro inverter development kit. The kit implements a complete grid-tied solar micro inverter based around TI's C2000 Piccolo TMS320F28035 microcontroller (MCU).

Rather than linking all solar panels in an installation together to a central inverter, solar micro inverter systems place smaller 'micro' inverters at the output of each individual solar panel. This lends to many benefits, including elimination of partial shading conditions, increased system efficiency, improved reliability and greater modularity. Easing solar micro inverter design.

However, solar micro inverter also poses complex challenges to designers. Designers must grapple with non-linear
