

Wanna Bet?

Your Website Does Not Have All These Features...

- Head-quarters on Google Map
- Facility to update branches, dealers and principals by uploading a spreadsheet
- Branch Office Finder
- Dealer Finder
- Principal Finder
- Located on a B2B marketplace with 20,000 monthly visitors
- High visibility within the marketplace

eleB2B.com

Get a micro-site (online showroom) on eleB2B.com and connect it with your website to avail all these features

If you want your online showroom to be built at India's leading electronics b2b marketplace, please contact ankush at 9810091664 or email at efyengq@efyindia.com

There are also functionality upgrades. These include adding the digital channels, arbitrary function generator, a variety of serial trigger/decode solutions as well as other advanced analysis packages, such as power analysis and limit/mask testing.

What are the different challenges that are solved by such an instrument?

Sometimes, when you debug, you do not find your point of interest or fault on your device in the time domain. The issue would be in the frequency domain, but because it is not visible in time domain the fault lies hidden. In such cases, it should be possible to change to frequency domain easily. And that's when design engineers pull over the spectrum analyser. Later, when the software and hardware come together, you understand what's happening to the protocol and have to co-relate every code to a physical signal, which is another spectrum analyser or the logic analyser of the scope. Every design house is doing something on this level of design, as this is how it comes together in the workflow. As long as there is a need to lower the time to market for a product, the trend will be seen going towards multiple scalable instruments, and design engineers will need the ability to get work done at one shot.

What else is being done to improve users' experience with instruments?

Another important aspect is usability and the user interface. If I am comfortable in using an oscilloscope, it might not be easy for me to use a different instrument, because the user interface, the contrast and the pattern that gets formed might be different. A crucial thing here is that engineers can spend more time on their design, because they don't have to spend time learning the instrument.

Will instruments like these make sense for start-ups and small design houses running on shoestring budgets?

When a design house starts up in Bengaluru, they might have just two or three people to begin with. Later, as the company hires more people and begins to grow, they will need instruments that grow with them. So rather than buying a new expensive instrument, they can simply upgrade their current basic instrument.

For low-power designs, any functionality or features that aim to help?

There is a power module that goes into some instruments. It aims to help the users with just that. Engineers who want to improve switching power supply efficiency can use it to measure power loss at the switching device. When working on low-power designs, one has to depend on the power supply that typically moves from linear to switching in order to be power efficient. Power modules like these allow you to look at the rise time and fall time of the switching, and can be used to evaluate various options like topology. ●
