

What is Inside this Month's DVD

This month, we bring a network designing and simulation tool, an optical simulation toolbox for MATLAB users and some popular circuit-designing tools, besides a PLC analyser and a universal JTAG library tool. Have fun!

PANKAJ V.

PerfDesign

PerfDesign is an application that aids in designing electronic systems. It enables quick design, sketching your projects on Perfboards and Stripboards. As a prerequisite, this tool requires a .NET framework 4 or higher to be installed on your system. This tool comes with an easy graphical user interface (GUI) for designing projects. It features the basic options to select board type and components, besides other functions.

Supported OS: Windows **Link:** <http://sourceforge.net/projects/perfdesign/files/latest/download?source=directory>

UrJTAG – Universal JTAG library, server and tools

If you are looking for an enhanced modern tool for communicating over JTAG to Flash chips and CPUs, then this tool could be the answer. This package enables you to work with JTAG-aware (IEEE 1149.1) hardware devices (parts) and boards through a JTAG adaptor. As a descendant of the popular 'openwince' JTAG tool, this version comes with a lot of additional features and enhancements. **Supported OS:** Windows **Link:** <http://sourceforge.net/projects/urjtag/files/latest/download?source=files>

Symica FE

Symica is an electronic design automation (EDA) tool for the analogue and mixed-signal integrated circuit design. It has all major capabilities of modern IC development suites, but this free version does not support mixed-signal features. **Supported OS:** Linux, Windows **Link:** <http://www.symica.com/products/symica-free-edition>

GNS3

With GNS3, you can simulate complex

networks on software in the closest possible way to how real networks perform, without having dedicated network hardware such as routers and switches. If you are studying for certifications such as Cisco CCNA, CCNP and CCIE as well as Juniper JNCIA, JNCIS and JNCIE, GNS3 can prove to be an excellent alternative or complementary tool to real labs. **Supported OS:** Windows, Linux, MacOS **Link:** <http://sourceforge.net/projects/gns-3/files/latest/download?source=dlp>

MIST

Modal interferometer simulation tool (MIST) is a MATLAB toolbox for simulation of arbitrary resonant optical systems. It uses a modal approach and a Hermite-Gauss modal decomposition is used to simulate diffraction-limited optics. You can use this tool to simulate large-scale interferometers with resonant cavities which are used for the detection of gravitational waves. You can define any optical setup with laser sources, lenses, electro-optical modulators and detectors, and compute the static laser field at any point.

Supported OS: Windows, Linux, MacOS (with MATLAB) **Link:** <http://sourceforge.net/projects/optics-mist/files/latest/download?source=directory>

PCB Artist 2.0

Use PCB Artist to create digital electronic circuits and schemas. This utility provides an easy-to-use working environment offering a step-by-step approach to set up any project. Apart from the conventional measurement units and layers, you can set up the board parameters (for example, material type and thickness), provide details about the board quantity and overall cost, as well as pick the saving directory and name. **Supported OS:**

Windows **Link:** <http://www.softpedia.com/dyn-postdownload.php?p=81392&t=0&i=1>

Logic Circuit 2.14.03.12

Logic Circuit is an educational software used for designing and simulating digital logic circuits. Its intuitive GUI allows you to create unrestricted circuit hierarchy with multi-bit buses and debug the circuit's behaviour with oscilloscope and navigate through the running circuit's hierarchy. We have included the latest version of the tool in this DVD, which includes Hebrew translation. And the bug from previous versions, which restrained the running of circuits with huge number of gates, has been fixed. **Supported OS:** Windows **Link:** <http://logiccircuit.codeplex.com/downloads/get/813236>

TI Connect

TI Connect is a new-generation link software from Texas Instruments which can be used for data transfer between a graphing calculator and a PC. This advanced package bundles a device explorer, backup and restore options, a data editor and a screen capturing utility, all working together for efficient device and content management. **Supported OS:** Windows, MacOS **Link:** <http://www.softpedia.com/dyn-postdownload.php?p=223553&t=0&i=1>

PLC-Logger

In this DVD, we bring you the latest version of this useful software tool which helps you to log and analyse data from PLC-Systems. Using this tool, you can access almost every PLC system running a Modbus TCP server while Simatic Step 7 connection and connection to CoDeSys-based PLC-systems are also supported. **Supported OS:** Windows **Link:** <http://sourceforge.net/projects/plclogger/files/latest/download?source=directory>
