

RF-Controlled Aircraft

I am interested in the RF-Controlled Aircraft DIY project published in May issue. Where can I get the magazine?

Kashmira Tamboli

Through e-mail

EFY: You can buy EFY magazine(s) from any of the following online stores: magzter.com, pothi.com, lulu.com, amazon.com, getscoop.com, rockstand.in, efymagonline.com, ebooks.electronics-foru.com and readwhere.com. Or, you can contact our associates Kits'n'spares on info@kitsnspares.com for the same.

Components for EFY Projects

Where can I get the components for the Mini Rechargeable Power Supply DIY project published in August issue?

Mehroz Afridi

Through e-mail

□ Please suggest from where I can buy components and PCB of the Medicine-Time Reminder circuit published in March issue?

Nandhini

Through e-mail

EFY: You can buy the major components like microcontrollers, CD40 series and 74LS series ICs, display modules, etc, from our associates Kits'n'Spares.

Missing Code in DVD

In the September issue of EFY Plus magazine, I found that the source code of the Celestial Weight Calculator DIY project is missing in the DVD. Where can I get that from?

Priyanka

Through e-mail

EFY: The source code for the Celestial Weight Calculator project is available for download on our website at www.source.efymag.com

Thermoelectric Bridge

I am interested in the Thermoelectric Refrigerator DIY project published

From Facebook: EFY's Electronics Design Community

Dear EFY, I had attended EFY's Electronics Rocks 2014, and I enjoyed the workshop and seminars. From where can I get the videos of all the seminars?

Sachin Ambesange

EFY: Thank you for attending the event this year. Please note that we have stopped providing DVDs for the same. Instead, we will be uploading the videos online and sharing the links with all the gold pass holders through email.

in March issue. I want to know the availability of thermoelectric module (TEC1-12706) used in the project. Also, please give some more details on the mechanical construction of this project.

Mihir Sojitra

Through e-mail

□ I have done some study on this project and came to know that the thermoelectric module has less efficiency. Is it possible to connect multiple modules for increasing the cooling effect?

Jitendra Mishra

Through e-mail

The author Sameer Gheewari replies:

The thermoelectric module can be obtained from ebay.com. It is mostly available from sellers in China. You can also check the local markets but, it may cost you more there.

Mechanical construction may vary based on the type of thermocool box used. The prototype in the article shows that the cool side of the thermoelectric module should come in contact with water in the box. If you stack multiple modules, you can just use a blow fan and have air inside the box cool it down. However, water acts as a good refrigerator.

You can definitely connect multiple thermoelectric modules to achieve more cooling. But, there are other factors that need to be taken into consideration.

Even when you stack these, overall efficiency of the modules will remain the same. Adding more modules would achieve better cooling at the cost of more power and heat sink/fan requirements.

'Spot An Error' Award Winners

In eStyle First Look section of September issue, the heading says Chromosome Desktop Launched by LG. It should be Chromebase Desktop.

Siddharth Kaul

□ In eStyle Buyers' Guide of September issue, the specification of Sony Xperia Z2 camera is wrongly given as 20 megapixels (MP). The correct specification is 20.7MP.

Karunesh Shukla

□ In component layout for the PCB (receiver side), the RX and TX connections are wrongly mentioned in the XBee-Controlled Aircraft DIY project in September issue. RX and TX pins of the Arduino should be connected to pins 2 and 3 of XB2, respectively.

Prashanth. S. Javali

□ In the popular resource section of EFY Plus September 2014 issue, the Free Download Manager is printed but Internet Download Manager software is provided in the DVD.

Praveen S. Javali

Each module is rated for 60W and thermal efficiency is 20-25 per cent. So, out of 60W, about 30W-40W is being converted into heat. As you stack modules, you increase the amount of cooling and the heat being generated. You need to dissipate this heat to the environment to prevent over-heating of the modules. This would require a bigger heat sink, fans and maybe even water cooling.

Stacking two modules should be fine, but you will still need a big heat sink and fan. Stacking more than two may require water cooling.
