

Wi-Fi Cameras: Focus, Shoot and Share

Smartphone cameras are capable of shooting and sharing photographs and videos instantly on Instagram and Facebook, but what about their image quality? If you do not want to compromise on quality, a Wi-Fi enabled camera may fulfil your need. It allows shooting and instant sharing of high-resolution images with highly powerful optical zooms, even in low-light situations

For the socially-connected people, who like clicking and sharing their moments, the Wi-Fi enabled camera is the device to have. Being social and being connected is the need of the hour.

Taking cognisance of the changing times, camera makers came up with Wi-Fi enabled cameras that have built-in wireless connectivity and can shoot and share pictures and videos simultaneously. So, all you need is a Wi-Fi enabled camera and Wi-Fi environment to get going.

Why a Wi-Fi camera and not a smartphone?

A few years ago, you had to use a film roll that you had to drop off at a processing lab. It was only after a few days that you could get your hands on developed negatives and prints. Then, the one-hour photo-labs evolved, leading to the digital ones. But now we can-

not wait that long. We see no need to download photographs from a memory card before uploading them on the web. Well, you must be thinking, why not use a smartphone instead of buying a Wi-Fi enabled camera? You carry the smartphone with you at all times, and it lets you shoot photographs whenever you want. Now give this a thought: Are you happy with the quality of the images your phone captures?

If you are a serious photographer, who does not want to compromise on the quality of the photographs, and also does not want to wait a single moment in sharing those photographs through applications such as Flickr, Facebook, Instagram, or Twitter, the Wi-Fi camera bridges this gap for you. At a minimum level, these cameras allow you to transfer photographs to your iOS devices, Android phones or tablets. And, if there is a Wi-Fi hotspot nearby, you can upload your shots directly to a web service from the camera itself.

Turn any camera into a Wi-Fi camera

Wi-Fi enabled point-and-shoot cameras retail at a higher price but if you want to save a few bucks, Wi-Fi enabled SD cards, called Eye-Fi, may be useful to you. These SD cards have in-built Wi-Fi antennae that can transform any camera into a Wi-Fi enabled camera. Since it is just 'work-around' technology, do not expect the high-end features of a Wi-Fi camera coming in. These cameras may also lack the on-screen interface. You can set up the Eye-Fi SD card on your computer and then place it in the camera, where the photographs are uploaded automatically to your computer or a web space, if connected to a Wi-Fi network.

Setting up your Wi-Fi camera

Once you have a Wi-Fi enabled camera in your possession, you just need to set up its basic features that allow photographs to be uploaded directly to a computer or a web service. There are some cameras which already have built-in photo-sharing
