

Jolt sensor (Courtesy: www.mhealthspot.com)

Concussion becomes worse if minor knocks and injuries are neglected. Now MIT graduates Benjamin Harvatin and Seth Berg have developed a device, Jolt Sensor, to detect these head injuries in real time.

Jolt Sensor is a small soft clip which is enclosed by a silicon rubber exterior. This sensor can be clipped to a headgear, helmet or any wearable on our head. It vibrates to alert whenever a chance is there for concussion. Jolt Sensor is totally waterproof and it can resist dust, sweat and rain. The device battery lasts for weeks and can be recharged through a standard micro USB port.

The sensor has another important feature: it can be connected to parents' and coaches' Android or iOS smartphones, wirelessly. They can keep track on the sports persons' ongoing events by using Bluetooth as its connectivity range is nearly a hundred metres.

It has a built-in cognitive test and concussion symptom checklist which helps the physio to evaluate the impact on the brain. If the injury is serious enough, the affected athlete is sent to a doctor who can take reference from the data collected by the app and sensor, which is stored in the cloud, to make the detection of concussion.

Telepathic mail communication may soon be a reality

Yes, it's true that telepathy happens and that now it can help in sending emails.

Messages can get transmitted without any motor or peripheral sensory systems, as has been proved by researchers from the University of Barcelona in Spain, Axilum Robotics in France, Harvard Medical School and Starlab Barcelona in Spain. They tried to devise a technology which allows transmission of an email just with the power of mind. In the screening test the conscious transmission was also performed by a volunteer in Thiruvananthapuram (India) as he sent greetings to a person in France.

Electrical impulses were recorded by electroencephalography (EEG) headsets. These impulses, created by chemical reaction between neurons of the brain, are fed into a computer interface. Then this electrical stimulation is used to implant translated message in the receiver's mind. Researchers made use of brain-computer interface (BCI), which is a crucial interface for creating brain-to-brain communication

BINAY Multichip LED Lamps

High reliability direct-retrofit LED bulbs for Control and Instrumentation applications

Ba9s bayonet pin cap

E-10 screw cap

Midget Flange cap

Midget Groove cap

5530 and 6844 slide base

Wedge base

Simple retrofits for existing filament bulb holders, in applications such as annunciator window (fascia) backlighting and illuminated pushbutton switches, where the reliability of indication is important or where lamp replacement is difficult or expensive

- Long life (typically 100,000 hours)
- Low power consumption;
- Low heat generation
- High brightness and wide-angle light emission
- Shock-proof and vibration resistant
- High reliability of indication
- One-time Expense

Binay Opto Electronics Pvt. Ltd.

44, Armenian Street, Kolkata 700 001, India
Telephone : (033) 2210 2039, 2210 3907, 4006 9875

Fax : 91-33- 2242 1493 <http://www.binayled.com>

POWERING LED TECHNOLOGIES WORLDWIDE SINCE 1983

BINAY PowerLED-based Industrial WELL GLASS Luminaires

BINAY's PowerLED Well Glass luminaires replace Conventional HPSV and HPMV well glass fittings

- 65%-70% LOWER power consumption over HPSV or HPMV
- Life of 10 to 15 years - requires no replacement once fitted
- FIVE-YEAR warranty
- Instant turn-on to full brightness
- Full-spectrum white light provides greater clarity and visual acuity; improves visibility and safety
- Optimized thermal management design for long life of LEDs
- Constant light output over 100V-260V operation
- Eco-friendly; eliminates hazardous disposal costs
