

Telecom Offers Mostly Developer and Installation Roles for Fresh Graduates

Network infrastructure, integration and IT are the three main roles available for fresh engineers in India's telecom sector today. Let us explore the other aspects related to a career in this sector and find out if telecom could be the best bet to kick-start your career

ABHISHEK A. MUTHA

According to a recent report, telecommunication services are likely to grow to 15% of the GDP by 2015. The escalation in the domestic market is expected to grow with the arrival of new players and launch of new services. This growth potential in the sector makes it a highly sought after sector by professionals. Let us dive straight into the kind of roles available for an engineer in this sector, followed by the diverse responsibilities of telecom engineers and their remuneration.

There are various roles available for engineers, such as radio frequency (RF) survey engineer, base transceiver station (BTS) engineer, microwave engineer and spectrum analysis engineer. But all these are limited in terms of numbers and allocation to fresh engineering graduates. For freshers, jobs are available mostly as network and integration engineers or as software/application developers.

A network engineer performs design, audit and optimisation of a network to meet a customer's requirements. This role is applicable for design and optimisation of radio access network, transmission, core and services networks. The network engineer can also be engaged in the whole process from pre-sales of services and networks to service delivery and acceptance. Basically, the role is more focused on executing, audit, design and optimisation services, where the network engineer is responsible for a part of the solution and a part of the service process. As a result, the engineer is responsible to keep timing,

You could be an integration engineer...

Responsibilities and tasks:

- Support pre-sales activities, including pre-studies
- Plan implementation of the product configuration/integration work
- Execute product configuration
- Execute integration work
- Prepare acceptance test and handover to customer
- Identify and drive improvements
- Perform post-project activities

Preferred requirements:

- Problem solving and troubleshooting skills

performance and quality according to requirements and the contracts.

An integration engineer can be expected to analyse, prepare, implement and verify the configuration and integration of a node, network or a system. A software engineer focuses on projects where C/C++ programming language is widely used. For managing the products, Java is the preferred language.

Tasks and responsibilities

The responsibilities in this sector depend

You could be a telecom engineer...

As a telecom engineer, you will be responsible for preparation and reviewing the project document including detailed designing of security systems like closed circuit TV, personal access system and intrusion detection. Candidates with oil and gas or building management system experience will be preferred.

Requirements:

Your engineering degree in instrumentation/electrical/electronics with 1 to 3 years of relevant industrial work experience would be an ideal fit.

on the position one holds. Depending on the area, be it installation, software, infrastructure or network, the tasks differ from company to company. See the boxes for some of the latest job profiles at reputed organisations hiring engineers to work in the telecom domain.

How remunerative is the job

For software engineers, George Abraham, associate vice president-Recruitment, Sasken Communication Technologies Ltd, informs, "The CTC (cost to
