

Toshiba **Motor Driver ICs** Save Space And Simplify Design For Low-power Or High-performance Applications

Toshiba Motor Solutions

Low power
consumption

Low
acoustic
noise

Low
vibration

Toshiba offers total solutions for a wide variety of household appliances.

Toshiba MCD Family Consists of Three Types:

Brushed DC Motor Driver ICs (Bridge Drivers)

- Highly efficient driver
- Used for switching or as an interface driver

Brushless DC Motor Controller ICs

- Sine wave PWM
- Contains three bi-directional drivers to drive high-current DC power
- Built-in bootstrap control circuit

Stepping Motor Driver ICs

- Low output ON resistances
- Forward and reverse rotation control available

Over 100 motor driver ICs to meet a wide range of needs

TOSHIBA's first unipolar motor driver (TB67S149) series

Product structure and packages

TB67S149 series

WQFN48

Package Size
7x7x0.7mm

Chip

Chip size is smaller, compared to the main chip of the competitors products.

Toshiba's new high voltage BiCD0.13um process made it possible for the TB67S149 series to be developed with **monolithic** structure.

Small chip = various package choices & low price.

The TB67S149 is the first general purpose stepping motor driver to apply the "accurate sense resistance-less control". It is one of Toshiba's sophisticated control technology developed with custom products

The TB67S149 covers up to **32 step** resolutions for micro step.

Less noise and less vibration.
