

Weather forecasts play an important role in our day-to-day life. A good weather monitoring system helps in better planning and any preparations that may be required in case of adverse weather.

World weather online

ated on the Internet. One such provider is worldweatheronline.com. It offers a free application programming interface (API) that can be used by the developers to get the weather data. A client device is needed to access the worldweatheronline.com API to get weather data by sending a uniform resource locator (URL), simply known as the Internet address.

The server provides three types of message formats for weather data: XML, JSON and CSV. The first two formats are a bit difficult to use because one must use format headers and keep track of special string of characters to identify data. The CSV format is simple because it uses readable characters where the data is separated by a comma (,) character.

"GET/free/v1/weather.ashx?q=madurai&format=csv&num_of_days=2&show_comments=no&no&key=yavjgrdusb6hpfct2jwek5c9";

Commands	Description
GET	Command used to get data from the server using HTTP protocol
Q	Name of the city for which weather data is needed (here, Q = Madurai)
Format	Format of data (here, CSV format)
num_of_days	Number of days for which the data is required (here, num_of_days = 2)
Show_comments	To display comments (here, comments are not needed = no)
Key	Access code received on registration
