

A Design Engineers' Conference & Expo

October 10-11, NIMHANS, Bengaluru

Workshops

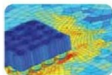

Embedded software: Develop products using Agile methodologies

Developing software in a fast-paced world with ever changing requirements is challenging work! This presentation will introduce Agile software development concepts. It will guide participants in managing the software development challenges faced in an embedded environment.

Make your own automation project with Arduino and Android

Have you seen all those cool automation projects controlled by an Android app? This workshop will take you through writing an Android application, and interfacing it with an Arduino board over Bluetooth, before finally building an automation project.

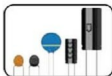

Multiphysics for design in electronics

See how COMSOL multiphysics can be used for capacitive, resistive and inductive device modelling. With multiphysics simulation, you can study heat transfer and mechanical properties along with electrical phenomena, thereby allowing you to analyse the performance of an array of devices – including passive components, insulating layers, electrostatic actuators and sensors. Additionally, you'll get to know how electronic layouts can be brought in for analysis.

Reducing power consumption using PicoPower technology

Atmel teaches you how to reduce power consumption in your circuits by using Atmel microcontrollers and making the most of PicoPower technology.

Capacitors and passive components

A free technology workshop will be held by Kemet, based on classroom instruction and live discussions. It will cover details on how capacitors and other passive components are made, how they work and their applications. The topics vary in technical complexity and are geared towards engineers, technologists, designers and technical decision-makers.
