support downstream broadcast such as video. EPON is typically deployed as a

tree or tree-and-branch topology, using passive 1:N optical splitters.

Conclusion

FTTx is a family of optical-fibre-based network system that is currently being widely adopted by several telcos to offer cost-effective, lightning high-speed telecom services to its customers through all-optical-fibre network. Technological improvement in the fibre optics domain has led to a new kind of passive optical network elements. EPON and GPON, being passive optical network systems, are very cost-effective for a variety of residential and business services like high-speed Internet, multi-play services, broadcast video, transparent LAN service, and many more. The fibre-optic technology is on the way for a series of technological innovations and developments that will continue to enable vast increases in offered bandwidth over long distances. ■

The author, currently with Lovely Professional University as assistant professor and previously associated with Bharat Sanchar Nigam Ltd, is PhD in electronics engineering from IIT (BHU), Varanasi and a recipient of senior research fellowship of UGC at Centre of Advanced Study (IT-BHU). His current research interests include wired and wireless technologies for high-speed telecom services
