

areas energy-efficient is much more than for transmission, distribution and generation individually.

How does Infineon try to be energy-efficient in its supply chain?

In order to make our products, we use electricity, chemicals, machines and other raw materials. We generate about one million tonnes of CO₂ in order to make our components. But, when you look at where these components go in the end application of our customers, like variable speed drives and efficient cars, about 4.6 million tonnes of CO₂ was saved with the use of our components. So 3.6 million CO₂ generation is saved with the use of our components.

Could you elaborate on your presence in India?

We have offices in Delhi, Pune and Bengaluru. We may open more offices depending on how the market grows and revenue develops. All the segments are handled in these offices and are a very important part of our R&D landscape. Manufacturing takes place mainly outside India. We contemplate setting up a manufacturing unit in the country on a regular basis. As the competitiveness of India rises for manufacturing, and the volumes consumed in India increase, it is only a matter of time before we set up a manufacturing unit in India.

What products and verticals does Infineon focus on?

Our focus is on energy efficiency, mobility and security. Within these three segments, we are very strong in addressing the power demands or the way energy is utilised—whether it is in energy generation, transmission or distribution. In cars, for example, the main factor is mobility and the focus is on car electronics in the automotive business and on construction and agriculture vehicles. Security too is very strong. With our techniques in chip card for transportation, banking purposes and government ID businesses, we are in a good position in terms of providing security.

In which verticals are you most successful in India?

Automotive, power, security and chip cards. We are generally strong in the field of power as it consumes a lot of our time and energy. Sixty per cent of our business is from energy efficiency-related products and we see great potential in India. The automotive industry in India is also growing and we expect to be successful here in the future. Security is a topic of concern in all our minds.

What's in your pipeline?

Our roadmap covers a whole range of requirements—be it a low-cost car made in India or a high-end, expensive car, we have components in that car. Components worth \$4 to \$700 go into a car. ●
