

4kV_{PEAK} Isolated Amplifier for Shunt-Based Current Measurement

Highest accuracy, reduced power consumption

TI's **AMC1200** isolated amplifier enables higher performing shunt-based current measurements in inverter applications within the motor control and green energy markets. The device provides **80 percent better linearity and gain drift** compared to competitive devices while reducing power consumption by 50 percent.

Features

- Very Low Nonlinearity: 0.075% max
- Low Offset Error: 1.5 mV max
- Low Noise: 3.1 mV_{RMS} typ
- Low High-Side Supply Current: 8 mA max at 5 V
- Input Bandwidth: 100 kHz typ
- Fixed Gain: 8 (0.5% accuracy)
- High Common-Mode Rejection Ratio: 108 dB
- Certified Galvanic Isolation:
 - UL1577 and IEC60747-5-2 approved
 - Isolation Voltage: 4000 V_{PEAK}
 - Working Voltage: 1200 V_{PEAK}
 - Transient Immunity: 10 kV/μs min

Applications

- Shunt Resistor Based Current Sensing in:
 - Motor Control
 - Green Energy
 - Frequency Inverters
 - Uninterruptible Power Supplies
