PRERNA JAIN

TINA TI 9

TINA-TI is a powerful circuit design and simulation tool based on SPICE engine that provides all the conventional DC, transient and frequency domain analyses of SPICE. It is preloaded with schematic symbol editor, TI macro models, linear and non-linear controlled sources, initial condition and nodeset components, and block wizard for making block diagrams. Unlike previous versions, it

allows a circuit to run just with passive components (not requiring actives). It also allows WAV files to be used as stimulus (signal sources).

TINA-TI has an extensive post-processing capability that allows you to format results the way you want them. Virtual instruments like XY recorder, oscilloscope, function generator, multimeter, signal analyser and bode plotter
