

allow you to select input waveforms and probe circuit nodes' voltages and waveforms.

TINA-TI is available in English, traditional and simplified Chinese, Japanese and Russian versions.

Bascom-AVR 2.0.7.5

MCS Electronics' Bascom-AVR features structured BASIC with labels and structured programming with if-then-else-end if, do-loop, while-wend and select-case. Compiled programs work with all AVR microprocessors that have internal memory.

The tool includes an integrated terminal emulator with download option, an integrated ISP programmer, and an integrated STK200 and STK300 programmer. It offers fast machine code instead of interpreted code, large set of Trig floating-point functions, and date and time calculation functions. There are special commands for LCDs, PC chips and 1WIRE chips, PC keyboard, matrix keyboard, RC5 reception, software UART and SPI.

Micro-Cap 10.0.8.2

The tenth-generation Micro-Cap 10.0.8.2 is a highly-affordable, easy-to-use, integrated schematic editor and seamless analogue/digital simulator. It blends a modern, intuitive interface with robust numerical algorithms and optimised codes, to give simulation power at a stunning speed.

The tool plots waveforms during the run—not after the run, when it is too late to change critical values. It offers dynamic analysis updates of waveforms and curves as you edit; periodic steady-state analysis; integrated active and passive filter design function; device library with over 24,000 parts; on-schematic voltage/state, current, power, and condition display; Smith charts/polar plots; multidimensional parameter stepping; Monte Carlo analysis; 3D plotting; IBIS model translator; animated LEDs, switches, bars, meters, relays, stoplights and DC motors; PCB interface to popular packages; and LAN version for collaborative projects.

It also provides transient analysis for investigating time-domain circuit behaviour; AC analysis for investigating small signal behaviour; DC analysis for plotting static DC variables; transfer function analysis for calculating the DC transfer function; sensitivity analysis for calculating the DC sensitivity of output expressions to circuit parameters; harmonic distortion analysis; and inter-modulation distortion analysis.

LayoutEditor and SchematicEditor

LayoutEditor is extensively used to design and edit layouts for fabricating microelectromechanical systems, integrated circuits (ICs), multi-chip-modules, chip-on-board, low-temperature co-fired ceramics, monolithic microwave integrated circuits and printed circuit boards.
