

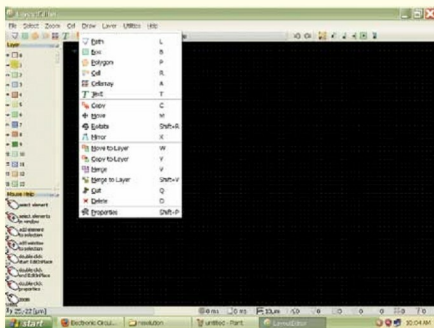

Fig. 3: Main display of LayoutEditor

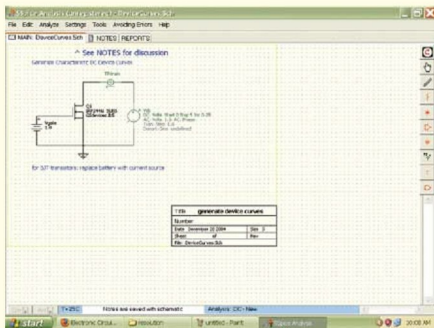

Fig. 4: DC device curves analysis in 5Spice

The tool has sophisticated functions like all angles, font generator, C++ macros, python scripting, boolean

operations, design rule checker, netlist driven layout and LVS. It supports a wide range of file formats like Calma

GDSII, OASIS (Open Artwork System Interchange Standard), OpenAccess, DXF, CIF (Caltech Intermediate Form), Gerber (RS-274X), LEF, DEF and Lasi Source.

The main display is a black field delineated by a grid of dots, with floating, draggable toolbars. The program uses Photoshop-style layers and cells that you can create, save and reuse. The work done on it resembles artworks in their geometric complexity and colourful patterns.

SchematicEditor is integrated in LayoutEditor to create electrical circuits and parametric layouts. It combines applications like entry for simulation, schematic-supported layout generation and documentation, making it a versatile tool for IC, MEMS, PCB and microwave applications.

5Spice 1.67

5Spice 1.67 focuses on analogue circuit analysis and circuit design at the component level. It provides Spice-specific schematic entry, the ability to define and save an unlimited number of analyses and integrated graphing of simulation results. It includes sub-circuits from a user-expandable library.

The op-amp and generic sub-circuit schematic symbols adjust the number of pins to match the number of nodes in the user-selected sub-circuit. Users can enter names for the pins which are then saved in the library. Temperature or component values can be swept and results plotted in a single graph. There is no need to keep track of circuit node numbers when graphing. The tool supports analysis of alternative designs and offers schematic symbol with user-defined equations. ●
