

eliminating the need for a complex receiver interface.

The receiver offers the flexibility to interface to virtually any device handler. In addition, fixture compatibility is maintained with the TS-900's current receiver.

Signal generators

Agilent Technologies has launched X-Series signal generators for the aerospace and defence segment. The X-Series signal generators are said to offer industry-leading performance, sophisticated software and low cost of ownership.

With these capabilities, the MXG and EXG products (available in analogue and vector models) support the development of components and receivers that meet the complex challenges of mitigating interference,

speeding data throughput and increasing signal quality in applications such as radar, military communications and consumer wireless.

Electromagnetic flowmeter

Flowtech Instruments Services has introduced an electromagnetic flowmeter that can measure flow of electrically conductive liquid in closed pipelines where the magnetic flux permeates the entire cross-sectional area of the liquid flow.

The meter measures the electromotive force to determine liquid velocity using Faraday's law of electromagnetic induction and compute the flow rate using the equation of conductivity. It

operates with electrically conductive liquids having minimum conductivity of 5 micro-Siemens/cm and is relatively immune to the effects of

temperature, pressure, viscosity and density of the flowing liquid.

TOOLS & EQUIPMENT

Pick-and-place machines

Agate & Agate Marketing Resources (I) has introduced EM series pick-and-place machines for LED assembly and long-length PCBs up to 1200 mm typically used in LED tubelights.

The machines use six vision systems and more than twelve types

of feeding systems. These also use a high-end optimising software. Rugged ball-screw mechanism driven by AC servo motors with closed-loop feedback function ensures accuracy of component placement.

Mounting speed of 13,500 CPH (IPC 9850) and rated speed of 18,000 CPH ensure capability to handle medium- to high-volume production.

Multicore evaluation modules

Texas Instruments (TI) has launched two new evaluation modules (EVMs) for its KeyStone-based TMS320C665x multicore digital signal processors.

The TMDSEVM6657L and TMDSEVM6657LE EVMs allow developers to quickly get started designing with TI's newest processors, the TMS320C6654, TMS320C6655 and TMS320C6657. Combining fixed- and floating-point capabilities, TI's C665x multicore processors deliver real-time high performance at low power coupled with smaller form factors.

Peripheral modules

Maxim Integrated Products has announced a collection of 15 peripheral modules that plug directly into any FPGA/CPU expansion port that follows the Digilent Pmod standard. Plug-in simplicity and easy software integration allow rapid prototyping and quick migration from concept to working design.

The modules support a variety of commonly used analogue and mixed-signal functions. These are supported
