

Telecom and education being the two major markets, what's the area of focus here?

For educational sector, equipment need to be simple to use but at the same time these should be able to meet the latest measurement requirements. Telecom sector is widely using optical-based technology for transmission and reception. So another category of T&M equipment is required for this segment.

Solution providers are quite in line with market demand. Newer versions of equipment and software are available to engineers, encouraging further work in the field of R&D to arrive at the next generation of products.

With 4G mobile network coming up and transition to IPv6 Internet addressing scheme, is the industry ready with new testing solutions?

At present, this concept is new in India and we are studying the requirements closely. But we have some equipment like vector network analyser that can meet this test and measurement need to some extent.

What are the priority applications for Aplaab in India?

We are focused on the field of education. Our focus was always to bridge the gap between higher-technology products and students who are new to the concepts and have to quickly fill up the gap to make themselves up to the

Telecom sector is widely using optical-based technology for transmission and reception. So another category of T&M equipment is required for this segment

mark with current development in electronics and electrical engineering areas. Besides, we are focused on telecom and defence segments for our range of test and measurement equipment.

What's brewing in Aplaab's R&D labs right now?

Aplaab's R&D for test and measurement instruments is focused on optical communication test equipment and certain range of RF measurement equipment.

Going forward, what would be a future test and measurement product like?

The test and measurement space is very dynamically changing. But with growing software developments, it is quite possible to design new concepts with simulation based on the measurement taken on similar circuits. This will reduce the engineering time for design and help professionals to quickly bring the product to the market. ●
