

Advantages of video analytics

Effective management of real-time video. The software watches multiple CCTV cameras within a CCTV system and notifies the user when action needs to be taken. So fewer security personnel are required to watch more cameras than a standard CCTV system.

Intelligent motion detection. Various algorithms analyse the video to determine the type of motion. This means the CCTV system only looks for the true motion of a person or vehicle.

Number plate recognition. Cameras can detect automobile licence plates, which can then be integrated in the system for behaviour monitoring. The technology also allows the cameras to determine the direction of vehicle movement.

Object recognition. Video analytics within a CCTV system also allows one to monitor for missing or unwanted objects.

Auto-tracking motion with PTZ cameras. Video analytics can also be coupled with pan/tilt/zoom (PTZ) cameras within a CCTV system, which enables auto tracking or real-time tracking.

Video analytics intelligently detects suspicious movement

buy 6000 CCTV cameras so that they can use the present 400 to integrate into the network. The cameras will facilitate pulling together real-time videos and broadcast video footage. With the help of optical fibre network, a video uplink will be created to the control room that comprises various workstation PCs having specialist application software installed in them.

These surveillance cameras will make vigilance easy and effective in

Mumbai that has been vulnerable to terrorist attacks since 1993.

Leave alone metros, CCTV cameras are being installed in busy markets of cities like Jaipur too. The master room to monitor the footage is stationed at the police station.

"Tier-II and Tier-III cities, currently having a small proportion of security system installations, are going to emerge as the real growth drivers of this technology-driven industry in the

long run," said Rawat.

Installing CCTV cameras helps in post-attack investigation besides combating security breaches and terror threats at sensitive places like railway stations, airports, hospitals and markets. It also helps the police in solving crimes like chain snatching and pick-pocketing in public places.

For instance, "The Jaipur Police has joined hands with various traders' associations to install CCTV cameras in busy city markets to strengthen security. Every shopping mall and busy market would be monitored by nearby police stations," according to a report published in *Times of India*.

As far as geographies and regions are concerned, major demand is coming from Northern India, which accounts for almost 35 per cent of the total sales. Northern India is followed by Southern India at 30 per cent and West at 25 per cent. Eastern India accounts for the rest.

Recent technological developments

CCTV cameras and digital video recorders (DVRs) are observing technological developments in several aspects ranging from storage capacity to image resolution to compression standards.

"IP/wireless cameras are the most recent developments with high-speed Internet connections available freely. The initial cost of the camera is high but as no cabling is involved, it saves a lot of installation time and cost," informs Harshal Desai, partner, Navatek Systems.

Some CCTV camera manufacturers in India

- AnG India
- AV Systems
- Digital India Security Products
- Electronic Eye Systems
- GW Vision Technologies
- Info Verge Communication
- Mantra Softtech
- Move Systems
- Nine Star Systems
- Samridhi Automation
- Vantage Integrated Security Solution
