

Some CCTV camera distributors

- ADI Global Distribution
- Aditya Infotech
- Aditgroup
- AMA Impex
- Ansjar Electronics
- Arise Security Systems
- AV Industrial Associates
- Avancar Security & Access Services
- AxeS Control & Security Solutions
- Axis Video Systems India
- CLD Electronics & Telecom
- Creative Info Services
- Dacess Security Systems
- Digital Eye
- Digital Identification Systems
- DVTel Inc.
- Elegant Technologies India
- Elixir Electronics
- Everfocus Electronics (I)
- Haritasa Electronics Inc
- HI Focus
- Hi-Safe Security System
- Huron Technologies
- IndigoVision
- InfriNova India
- Inspirations
- Mark Electronics Corporation
- Mobotix AG
- Navatek Systems
- Nimbus Technologies
- Plus 91 Security Solutions
- Prama Hikvision India
- Risco Group
- Sarga Systems
- Shelian Systems
- Silvan Innovation Labs
- Star Catalyst
- Total Surveillance Solutions
- Vicon Industries
- Videotec Spa
- Websecsystems India

Intelligent video analytics has altogether changed the perception for DVRs in the video surveillance industry. It is obvious that with increase in the demand of the product, the technological and feature enhancement will happen. At the same time, competition

in the market will make the product cost-competitive and value-for-money for the customers.

Video analytics or intelligent video surveillance (IVS) technology turns CCTV cameras into predictive tools that allow the users to spot problems brewing and prevent incidents in a more proactive manner, rather than just filming the events for later investigative use.

This technology uses software to automatically identify specific objects, behaviour or attitudes in video footage. It is basically used for intrusion detection and transfers to the software the human interventions normally required to detect intrusions.

This technology has the capability to analyse a video frame or a group of video frames to detect, classify, recognise or identify a predetermined event that has been programmed through the IVS software. It uses mathematical algorithms to detect moving objects in an image and filter non-relevant movements. It then creates a database that records the attributes of all the objects detected and their movement properties.

Video analytics technology works best for large infrastructures, such as a mass transit system, where over a thousand surveillance cameras may be deployed. These installations represent a huge amount of video to transmit, view and archive, making it impossible for a human monitor to analyse all these

video recordings in order to detect suspicious behaviour or events.

New features being included in these systems are smoke detection, behavioural analysis, features for military applications, forensic studies, 3D volumetric analysis, etc.

What's selling the most

"Analogue camera market will not achieve greater scale. Currently, IP cameras are relatively higher priced and hence sales are lower. If the IP camera cost can be reduced, these will overtake analogue camera sales," says Hiren Bhandari, director (technical), Mantra Softtech.

"Each CCTV camera model has a unique feature that can be used for different purposes and provides different image quality. Widely selling cameras include box, dome, IR dome and bullet. However, dome cameras are most popular as these are easy to install. Also, it is difficult for anyone to tell in which direction the lens of the camera is pointing, which eliminates the possibility of any fraud. These cameras are available in several models as well," informs Ray.

CCTV cameras for homes are usually small and compact in size compared to commercial CCTV cameras. Home systems are mainly standalone. On the other hand, commercial systems are network systems which can be viewed from several locations. Also, business applications require more accurate imaging defined by TVL.

However, the major differences between the home and commercial systems are the associated features.

Generally, commercial/business houses use DVRs with a large storage capacity and central monitoring software to view several systems
