

friendly interface that uses concepts familiar with the artists and musicians who use the program. So the user need not have a great deal of familiarity with multi-track editors to be able to record. Jokosher provides tools for splitting, trimming and moving, when editing.

The software allows multi-track volume adjustment during mixing with VU sliders. Audio-tracks are called instruments in Jokosher and a range of instruments can be added to a project and renamed, muted and soloed easily. Jokosher can import audio from various formats like Ogg Vorbis, MP3, FLAC, WAV and anything else supported by GStreamer into projects. After recording, it can export back to any of these formats.

Libsndfile

libsndfile is a widely used 'C' library for reading and writing audio files. It supports a wide variety of audio encodings and sound file formats. It allows the programmer to ignore many details, including endianess. In addition to the library itself, the package provides command-line programs for converting one format into another, playing audio files and obtaining information about the contents of an audio file.

LMMS

Linux Multimedia Studio (LMMS) is a free software digital audio workstation. Using LMMS, music can be produced by synthesising sounds, arranging samples, and playing on a MIDI keyboard by combining the features of trackers, sequencers and synthesisers. The software supports LADSPA and VST plugins.

Some features of LMMS include song editor for composing songs, beat+baseline editor, FX mixer with 64 FX channels, piano roll for editing patterns and melodies, automation editor and MIDI keyboard support.

OpenMPT

OpenMPT is an Open Source audio module tracker for Windows. Though

Fig. 3: Creating tracks with LMMS

primarily a tracking software, it has a few sequencing capabilities too. It can play software plugins that adhere to Virtual Studio Technology. It's also possible to not only set up external MIDI devices for both input and output but also chain together many sets of output routes that lead to Master Audio.

SynFactory

SynFactory is a free and Open Source software synthesiser for Windows. It is based on the same sound generating principles such as subtractive synthesis as used in vintage modular synthesisers. Patches can be built from separate components and connected together with virtual patch cables. Due to the flexibility of the system, the range of sounds that can be created is huge. The synthesiser is always live and there is no separate edit mode.

Sonic Visualiser

Sonic Visualiser is a free software system that allows you to visualise, analyse and annotate sound files. It is used in musical as well as scientific work. The software can make use of highly specialised third-party plugins in vamp plugin format.

Traverso DAW

Traverso DAW is a cross-platform multitrack audio recording and audio editing suite with support for CD mastering and non-linear processing. It offers a unique user interface using both the mouse and the keyboard together for precision and speed.

Ubuntu Rescue Remix

Ubuntu-Rescue-Remix provides a robust yet lean system for data recovery and forensics. No graphical interface is used. The live system can boot and function normally on machines with very little memory or processor power. It features a full command-line environment with powerful free and Open Source data recovery software including ddrescue, Photorec, Sleuth Kit, Gnu-fdisk and Clamav. It also includes ddrutlity – a new tool to identify files affected by unrecoverable blocks on a disk image. The software has a huge community and extensive documentation. So it is quite easy to find help when you need it. To use the software, first copy the .iso file provided with EFY Plus DVD and then burn it on a CD/DVD or a USB drive. ●
