PIC development board by Kits'n'Spares, New Delhi

When it comes to professional degree levels, more and more institutes are becoming aware of professional-/ industrial-grade kits and lab solutions that can provide an industry-like exposure to the students in their very own labs and thus improve their employability. Retailers too have started to keep some of these affordable kits for young hobbyists and students alike.

Starting and running the business

Anybody willing to enter the educational kits industry should focus on solving specific problems of the targeted segment. He should be able to understand the problem at consumer level and come up with a solution that does not exist in the market. It is a long-term business and requires three to five years to succeed in the market. Technical support for the products offered is the key to success.

Amar Gala, partner, Gala Electronics (Vegakit), cites capital investment on a large scale, huge inventory and research team for new projects as the key requirements of this business.

However, the capital investment and skills needed to start a kits business are not a big challenge. The biggest challenge is the design and development of these kits within the

country. The raw material needed to develop these kits and the related ecosystem of these DIY retailers is fairly limited within the country.

The key factor to succeed is the sweet-spot where your kit design meets the challenge for a ubiquitous development of the same (given the availability of parts/components), at a price point where you have a relatively good market opportunity.

In addition to the parts issue, there is a lack of the clear definition of the market and its needs. As the market is not well-defined or structured, the needs are scattered all across with local system integrators trying to meet them with their limited knowledge or expertise of technologies available around the world.

To address some of these challenges, principal original equipment

Some educational kit/solution providers in India
