

Pico Projectors for People on the Move

Catering to the needs of people on the go, pico projectors project a large image from a small one. Today, these projectors have become so small that they are increasingly being embedded in mobile phones and cameras. Doing away with the need to carry other devices, a few standalone models also support internal memory

PRIY PANDIT

Entertainment and productivity literally reside in the pockets of business travelers, movie-buffs or even plain gadget enthusiasts these days. The fab trimming, belt-tightening trend has certainly engulfed projectors too, giving rise to a new breed called pico projectors.

When we say 'projectors,' the first thing that comes to our mind is a large, bulky device used in our offices and colleges for presentations. The

continuous evolution of technology has now enabled us to get a cinematic video projection from a compact device. Welcome to the world of pico projectors!

Catering to the needs of people on the go, pico projectors project a large image from a small one. Today, these projectors have become so small they are increasingly being embedded in mobile phones and cameras. Doing away with the need to carry other devices, a few models also have internal memory. These projectors tend to be cheap. If you are one of those who

always carry a laptop or tablet, this tiny device can be of some great utility.

Before delving further, the key thing to consider is that these projectors are not very bright. They require a 'completely' dark room to display images decently. So don't go for these portable pups if you are hoping for a vivid image that comes out of a full-fledged large projector.

Choose the devices you wish to connect

Just like media players, these projectors can comfortably pull video signals from a variety of devices like DVD players, laptops, mobile phones and cameras. If you have the latest models of these devices, you need not worry about their compatibility with your pico projector. The more inputs the projector has, the better. It would be wise to check which devices you are likely to pair before choosing a projector. Among the most common inputs are VGA (laptop), A/V (RCA) and Composite. Addressing the demands

Some pico projectors require two USB ports (one for video data and the other for power) and are specific OS-compatible
