

inserting a control relay coil, 'CR' is automatically attached as the standard beginning label anticipating it to be followed by '1', '2,' etc

5. Double-clicking anywhere in the drawing enables 'Line' control option

6. Easy and precise labelling of wire numbers is possible

Robei

Robei is claimed to be the world's smallest EDA tool for FPGA design and simulation. With this tool you can design your hardware visually anywhere, and view the simulation result through waveform. It is a fast software for hardware prototyping and verification. It runs on any Android platform. This allows you to implement your design and test it immediately.

Robei is cross-platform, working on Windows, Linux, Mac OS and Android. It is also the first FPGA simulation tool that works on embedded platforms.

Robei has almost all the functionalities of an EDA software. It has the latest GUI, Verilog compiler, property editor, code viewer and waveform viewer. The user interface of Robei provides visualisation of FPGA design and simplifies it by playing with reusable models and ports. Toolbox is designed to contain huge model libraries. Property designer allows users to view and change values in the code very conveniently. All these parts are designed to be very simple for the designer. It requires only 15 minutes to manage this software as long as you are familiar with Verilog language.

In short, Robei offers many advantages over some other software:

1. Besides being cross-platform, it is also the first to run on a mobile platform

2. The user interface is easy to learn and use

3. Both bottom-up and top-down designs are supported, so you can double-click the model to view inside

4. Standard Verilog code is generated, which can be used with any

FPGA design tool

5. An integrated code editor for Verilog coding directly opens up the door for complex design

Sprint-Layout

Designing and optimising your PCB layouts is quite easy with Sprint-Layout.

Sprint-Layout offers all the functions to design your own layouts.

There is an extensive library with all the common components included. You can start drawing your layout immediately using the tool.

There is also an excellent print-out procedure with many options available for manufacturing your PCBs by hand. Sprint-Layout files can be converted to Gerber and Excellon formats, which are supported by almost all PCB manufacturers to
