

Result achievement accelerated with parallel computing. Parallel optimisation allows users to organise the distributed routing by using several processor cores and/or several computers within one local network. Routing of complex multi-layer boards is possible with significantly reduced machine time.

Increase in engineers' productivity. TopoR supports two types of manual PCB routing topologies—graphical and topological. Topology router automatically calculates the optimal shape and wire positioning in terms of the defined topology. This allows engineers to concentrate on topological aspects of the design without paying attention to the wires shape and observing technological restrictions. Touching or even number of wires intersections is not considered a violation. It is sufficient to push a button and move to the topological mode to string the wires automatically and

move them to the necessary distance.

2. Design of complex and high-speed PCBs. TopoR CAD system allows to set limitations for wires length and classes as well as adjust the length of wires related to any class with specified precision. During the wire length adjustment, TopoR uses randomly-oriented trapezoids. Wire length precision is 50 nm. Further, TopoR offers efficient autorouting of differential pairs. Equality of conductors length in a pair is provided with the precision level set in the routing rules.

3. Project data exchange with most common CAD systems. Advanced export/import features for project data exchange allow use of TopoR in conjunction with the majority of contemporary CAD systems for PCB design. TopoR supports import and export of PCAD, DSN and PADS ASCII PCB files. Design

results can be output in DXF and Gerber formats.

4. Increased PCB reliability. TopoR allows you to design PCBs with improved reliability as well as enhance other production and performance characteristics. Improved EMC, reduced overall number of structural components and design simplification lead to enhanced reliability.

5. Manufacturing costs reduction. TopoR significantly reduces PCB production costs as it allows users to design boards with less number of layers while avoiding use of expensive blind and hidden vias.

Less strict design rules help to save money by allowing less expensive technological process of manufacturing PCBs. Smaller PCB surface leads to less use of expensive PCB material. ●
