

IS YOUR MCU MAKING YOUR JOB
HARDER THAN IT HAS TO BE?

NOT ALL SYSTEM- LEVEL POWER ISSUES ARE THE SAME.

Our latest 32-bit
MCUs enable up to
65% longer
battery life
than competing solutions

Introducing Precision32™

32-bit mixed-signal MCUs engineered to make your job easier.

Tired of one-size-fits-all approaches to low-power design?

Silicon Labs' SiM3L1xx Precision32™ 32-bit microcontrollers based on the ARM® Cortex™-M3 core feature innovative power-saving features, highly-integrated analog functionality, advanced low-power peripherals that don't draw power from the rest of the system and a patented crossbar for maximum design flexibility without compromising performance:

- 175 μ A/MHz active mode; $\leq$ 250 nA sleep mode with real-time clock enabled at 3.6 V
- Register state retention enables a fast 4 μ s wake-up time
- Integrated, high-efficiency dc-dc buck converter reduces active mode power by 40%
- Patented LCD controller reduces the display power consumption by nearly 40%
- Specialized peripherals designed to reduce power in wireless or sensor applications

Complex low-power issues? No problem.

Download white papers, data sheets, free software drivers and tools, and order hardware to start prototyping today.

Power aware tools to optimize your system!

The free Precision32 Eclipse-based IDE features enhanced "power aware" tools to help you architect firmware for low-power consumption—see the total supply current and which peripherals are consuming the most power, updated automatically as configurations change.
