

backplane power rail, which is very typical in base stations, blade servers and networking equipment. This requires the hot-swap controller to limit inrush current when first powering up as well as react to transient and overload events and report system power consumption.

What are the latest trends in the industry?

Energy efficiency is a hot topic in India. Customers are increasing design activity for applications that help improve energy efficiency, such as LED-based streetlights and renewable energy applications like solar power. We continue to develop analogue and embedded processing components that help our customers achieve higher energy efficiency in designs ranging from large solar panels and batteries used in UPS systems to brushless DC motor drives.

How does the new generation of analogue and embedded processing components improve energy efficiency?

Improving energy efficiency takes a very comprehensive approach. We use new processes to reduce losses in the power path, for example. We are developing a new QFN packaging technology that helps maintain this very low loss achieved by our process. Additionally, these packages have a very high thermal performance, which helps these devices operate at lower temperatures and provide even

lower resistive losses.

In addition to making our chips more energy-efficient, we have designed into our products features that enable our customers to develop energy-efficient applications. For instance, in the case of LED lighting, TI has introduced products with constant power regulation that improve the efficacy of light fixtures by up to 10 per cent.

Another new technology incorporated in recent products is intelligent management of triac dimmer hold circuitry, which dissipates energy only when the dimmer is conducting. Most of TI's lighting products are now offered with analogue and PWM dimming controls as well, making it easy for sensors to adjust the LED light output depending upon environmental conditions such as daylight, dark or occupancy.

How do you help startups innovate?

We have a dedicated programme for startups and independent design houses (IDHs) as part of our third-party and partner programme called TI Design Network. We collaborate with these startups and IDHs to develop solutions and provide other technical support to address their innovation challenges. Since IDHs in India are very active, this is another opportunity for us to get in on the ground floor with future big customers. ●

Telephone Call Recorder

Xtend Voice Logger provides real-time monitoring/alerting and flawless recording of all incoming/outgoing calls from Analog/Digital/VoIP telephone lines. Besides listening, auditing and tracking audio records, the web-based remotely accessible centralised voice logging system facilitates comprehensive reporting and easily enables exporting of call logs in GSM/MP3/PCM formats for in-depth analysis and assessment.

Deploy in single/multi-site environments to enhance business productivity and customer satisfaction.
