TEST & MEASUREMENT

Analogue oscilloscope

Scientech Technologies has launched Scientech 852, which is claimed to be the first affordable analogue oscilloscope combining spectrum analysis and os-

cilloscope functions. Equipped with a built-in tracking generator, this spectrum scope can be used to check the frequency response of amplifiers, filters, etc. Scientech 852 can also be used to evaluate EMC problems at prototype design level.

Scope apps for Android smartphone

Tektronix has introduced three oscilloscope applications—Oscillo Connect, Oscillo Analyzer and OscilloTriggevent—for use on Android smartphones. The free apps, available now on the Google Play store, allow users to remotely control and monitor their oscilloscopes, or view and analyse waveforms on the go.

In today's world, engineers are often tasked with multiple projects and no longer have the luxury to sit at the engineering bench all day. These applications point the way to a full set of apps that will help engineers and technicians stay productive while on the road, during meetings or waiting in line at the supermarket.

Probes for high bandwidths and high voltages

Rohde & Schwarz has introduced two new probes. RT-ZS60 active voltage probe is said to be the perfect solution for any task requiring ground-referenced measurements of signal integrity. This includes tests on fast interfaces such as DDR memory modules or general analyses for aerospace and defence, research and consumer

electronics. It is claimed to be the first compact, ground-referenced 6GHz probe on the market.

For automotive, power and medical technology applications, RT-ZD01 active, differential, high-voltage probe offers the benefits of a selectable measurement range, which provides the ideal dynamic range with its maximum measurement voltage of 1 kV (RMS).

Digital power meters

Yokogawa Meters & Instruments Corporation has released WT310 and WT330 series of digital power meters. These meters are useful in reducing the power consumed by electrical and

electronic instruments, and are suitable for use in applications ranging from R&D to production.

Ordinary power meters need to switch measurement modes depending on what is being measured—from voltage, current and power to items such as integral power consumption and harmonics analysis that require calculation. WT310 and WT330 series meters can measure all this in just a single measurement mode. Moreover, the short measurement interval of just 100 ms improves measurement efficiency.

Embedded power analyser for LED lighting

Empower Technologies has introduced an embedded power analyser for LED lighting. The equipment can be used to take all measurements simultaneously to test PFC (power factor correction), voltage and current for LED lighting products.

The device has built-in variac (0-300V AC, 10A), LED/LCD power meter (PFC, kVA, watt, frequency, current, voltage), DC voltmeter and ammeter, and resistive load zigs. With 0-30V/5A variable power supply you can test all DC-DC drivers. You can also check battery charging voltage and current with the help of battery simulator.
