Microcontroller development platform

NGX Technologies has introduced a cost-effective evaluation platform for LPC series of microcontrollers from NXP.

Xplorer++ is available for LPC1788, LPC1857, LPC4088 and LPC4357 microcontrollers. It is a ready-to-run development platform with code snippets to demonstrate applications for every feature supported on the board. It offers ubiquitous interfaces, making it the best board available for the offered price—according to the company. It is priced at Rs 3100.

Hand soldering systems

Power2U Technology India has introduced Thermaltronics TMT9000S hand soldering systems. Designed in Australia for lead-free/leaded solder-

ing, the new TMT series requires no calibration. Using Curie Heat technology and induction heating, it rapidly transfers heat to soldering tips.

TMT systems offer longer tip life and increased productivity, making them ideal for electronic PCB assembly and SMT rework.

LED pairing software for LED placement systems

With the new SIPLACE LED Pairing process, LEDs and their associated resistors can now be selected and placed on both sides of the circuit board. This saves time and makes placing LEDs and matching resistors even more efficient.

To place these components on both sides of the PCB, barcodes must be affixed. Based on these codes, the SIPLACE LED Pairing recognises even across two line runs which resistor must be assigned to which LED. This also happens automatically during the second run, i.e., when the bottom of the board is populated. This saves material and production time while simplifying the LED placement process considerably.

COMPONENTS

MOSFETs

Taiwan Semiconductor has introduced low-voltage (<40V), mid-voltage (40V-200V) and high-voltage (up to 900V with low $R_{DS(on)}$) MOSFETs. These MOSFETs find a wide range of applications in consumer and automotive markets.

Single-phase energy-measurement processors

Maxim Integrated Products has introduced 78M6610+PSU and 78M6610+LMU single-phase energy-measurement processors. These processors are an energy-measurement subsystem in a single chip. They provide simple utility-grade sensing and diagnostics for existing designs without the traditional cost of a utility

meter system-on-chip.

78M6610+PSU is designed specifically for real-time monitoring at the input of AC-DC power converters used in data centres and IT server rooms.

78M6610+LMU, on the other hand, is a more general-purpose solution for applications such as smart plugs, EV chargers and solar inverters.

300V power MOSFETs

International Rectifier (IR) has introduced a family of 300V devices featuring its latest power MOSFET silicon. The new MOSFETs are said to deliver benchmark 'on'-state resistance for a wide range of high-efficiency industrial applications such 110-120V AC line conditioners and

110-120V AC power supplies, and DC-to-AC inverters including solar inverters and uninterruptible power supplies (UPS).

These power MOSFETs improve system efficiency and allow designers to reduce part count where multiple MOSFETs are used in parallel.
