

10 Hot Gadgets Unveiled at CES 2013

For the first time in recent memory, Consumer Electronics Show (CES) 2013—the much talked about event of the consumer electronics industry held recently in Las Vegas, USA—was not kicked off by a keynote from Microsoft.

Nonetheless, the best of innovations and gadgets were showcased at the event, with a significant share of ultra-HD 4K TVs and Windows 8 tablets. In addition, the expo saw launch of some innovative products highlighting the fact that how far we have come in just a few years. Here are the ten hot gadgets from CES 2013 to feast your eyes on...

MONIKA BHATI

Pebble smart watch

The future looks bright for smart wearable devices with around 70 million such devices likely to be sold by 2017. Here is a smart watch that connects to your iPhone or Android smartphone, making it more accessible by being on your wrist. Pebble's colourful multi-layer polycarbonate

face/bezel looks fantastic. Weighing just 38.2 gm, the device is customisable with beautiful downloadable watchfaces and useful Internet-connected apps.

Pebble connects to iPhone and Android smartphones using Bluetooth, alerting you with a silent vibration to incoming calls, e-mails and messages. The smartwatch is equipped with a backlit e-paper display. It also includes a Bluetooth 4.0 radio, vibration motor, accelerometer and compass.

Oculus Rift virtual reality glasses

For long the ultimate promise of technology has been virtual reality and the Oculus' head-mounted display seems to have delivered on the promise. It's really

amazing. Putting these VR goggles on your face makes you feel as if you are within another world—as a wide field of view, high-resolution display and head tracking immerse you in your favourite video game quickly and smoothly.

It is important to note here that these VR goggles are light and natural-feeling on the face. According to a report, the Oculus Rift was more impressive than any ultra-refined tablet or even 4K TV showcased at CES this year.

Tactus Technology tactile touchscreen

Tactus Technology has developed a new tactile user interface for touch-screen devices. The interface features application-controlled, completely transparent physical

buttons that rise up from the touch-screen surface on demand. With the buttons enabled, users can push and type or rest their fingers as they would with any physical button or keyboard. When the buttons are disabled, they recede into the screen, becoming invisible and leaving a smooth, seamless flat touch-screen with maximum viewing area.

While touchscreens provide a versatile user experience, they provide no tactile experience for consumers. Vibration haptics and similar solutions try to simulate a sensation of touch, but all are feedback technologies, vibrating only after touching. In contrast, Tactus' technology creates real, physical buttons, where users can rest their fingers on the
