

A secure device to store your passwords

Passwords are so difficult to manage, and nowadays everything needs a password. You need to remember dozens of passwords, they all have to be dissimilar, you have to keep changing them frequently, and you cannot even write them down! If this dilemma sounds familiar, then myIDkey is sure to catch your attention.

myIDkey is a voice-activated, fingerprint-authenticated USB drive that stores passwords, email IDs, numbers and such personal information and displays it on its built-in screen. It is a handy and secure tool, which will be launched this year and is likely to cost around US\$ 120.

Inside: myIDkey features voice search, secure 16GB storage, a Cloud-based password management platform, auto deletion of information on multiple wrong accesses, recessed high-contrast organic LED screen, Atmel microcontroller with high-performance ARM Cortex-M3 32-bit RISC core operating at up to 96 MHz, fingerprint authentication using a digital signal processing controller with AuthenTec's AES1711 biometric fingerprint reader and their patented TruePrint and TrueMatch technologies, and data security with military-grade AES 256 encryption.

Fostering innovation with cloud-based interactive learning

This easy-to-use, low-power cloud computer claims to turn a normal class into a connected, secure and highly interactive learning environment by setting up a micro-cloud for up to 60 students. It facilitates the delivery of educational content and applications via a range of mobile devices including smart phones and tablets.

Inside: The device is powered by Marvell's high-performance, low-power ARMADA 300 series system-on-a-chip (SoC) and the company's industry leading Avastar 88W8764 wireless chip. It includes 1 GHz of Flash and DDR3 memory as well as Stanford's Mobile Inquiry Based Learning Environment (SMILE). Network connectivity is through Gigabit Ethernet, and peripheral devices can be connected using USB 2.0 or Wi-Fi. It comes with optional rechargeable battery back-up, access to SMILE learning applications, an external debug board, application programming interface and user interface for easy plug and play of devices, and an open platform that enables development and porting of additional learning applications.

Smart glasses that connect to the cloud

First-person augmented reality is finally here. Vuzix Smart Glasses M100 is claimed to be the world's first commercially-available, hands-free display and communications system that can link users to the Cloud. While M100 is powerful enough to directly connect to the Internet and run applications, it can also connect with Android or iOS smartphones to run a richer set of text, video, audio, maps, email, augmented reality applications, visual navigation, etc.

Inside: Optics engine that supports WQVGA colour 16x9 displays, diagonal 16-degree field-of-view, built-in OMAP 4 processor and graphics engine, fully-optimised Android 4.01, 4GB memory, integrated button controls, integrated head tracker and GPS with three-degree-of-freedom head tracking for spatial and positional awareness, integrated compass and battery, Bluetooth and Wi-Fi connectivity, noise reduction technologies, 1080p high-definition camera, μ USB connectivity for control, power and upgrade.
