VNA Master MS2038C

It isn't stealth if they can find you.

Pre-flight confirmation of radar cross section (RCS) for stealth aircraft is a critical element of modern flight line operations. Airframe repairs must be tested to ensure that stealth performance is not compromised, but in the heat of battle you can't afford to have a fighter out of operation to look for hotspots. Fortunately, Anritsu has a solution.

Anritsu's VNA Master™ MS2038C is the industry's *first* handheld 20 GHz vector network analyzer. Covering all radar bands from HF OTH up through K_u, the MS2038C offers time domain analysis with gating — allowing you to do radar cross section measurements right on the flight line. Faster confirmation of RCS means less downtime and greater operational efficiency.

Find out more about Anritsu's RCS test solutions and download our application note. Visit www.anritsu-offer.com/mwj-rcs/ or call **1-800-ANRITSU** to place an order or schedule a demo today.
