

An ISO 9001:2008 Certified

Crisp System

Voice Recording and Play Back Module

₹ 490/-

Speech Recognition Module (HM 2007)

₹ 4900/-

MP3 Module

₹ 990/-

Serial to USB Converter Module

₹ 390/-

RF Wireless serial Module

₹ 490/-

Ultrasonic Module

₹ 599/-

GSM Modem (SIM 900)

₹ 1499/-

GPS Module

₹ 1999/-

Finger Print Sensor

₹ 3750/-

Loadcell Interface with Platform

₹ 1490/-

All the above Modules are Ready to Interface with any Micro controller

A new computerised brain has 2.5 million computer-simulated neurons

Spaun, it can recognise characters and perform simple actions like arm movements. It includes an eye capable of viewing a 28x28-pixel image. Spaun is even capable of performing complex operations like ordering data. It can be programmed for long- and short-term memory functions.

"This computerised brain needs to be speeded up a massive amount before it comes anywhere close to the speed of the human brain. At the moment, Spaun takes around two-and-a-half hours for processing a thought, which takes a few seconds for the human brain," said Terrence Stewart, post-doctoral research associate on the project in The Register report.

Inner ear 'battery' to power tiny devices

Our ear's cochlea has its own natural battery with ions that help create a tiny electrical voltage. Taking cue from this, scientists are working on chips with such low power demand that this voltage might easily power them.

According to the latest research by scientists from MIT, Massachusetts Eye and Ear Infirmary (MEEI), and the Harvard-MIT Division of Health Sciences and Technology (HST), the technique could make it possible to make self-powered implantable medical devices that could be used to diagnose and treat disorders related to the ear or even the brain.

In their experiments on guinea pigs, researchers demonstrated that the tiny, low-power devices attached

to electrodes implanted in pigs' ears could wirelessly transmit data about the chemical conditions of the ear to an external receiver.

The ear's cochlea houses a biological battery chamber divided by a membrane, some of whose cells pump ions. Because potassium and sodium ions on opposite sides of the membrane are not in balance, an electrical voltage results.

Contact lens that can receive text messages

A new type of contact lenses have been developed that can receive and display text messages from your mobile phone.

Designed by the Center of Microsystems Technology at the Belgium-based Ghent University, these contact lenses have a spherical curved LCD display that can handle messages projected from the mobile phone using wireless technology.

According to a Telegraph report, these lenses are different from the previous versions that utilised just a small area on the lens for image reproduction. The new lenses utilise the whole surface as a display. These utilise Bluetooth wireless technology to receive data and project it on the user's eye.

A bag that can also charge your gadgets

A company named Kickstarter has come out with a smart bag called Phorce that not only holds your gadgets but also charges them up. Phorce is equipped with a wall charger, which
