

Voltech POWER ANALYZERS

Pm1000+ Next Generation Power Analyzer

Pm5000 Multi-Phase Power Analyzer

Application:

- Power Transformers
- Solar
- Wind Power Plants
- Substation / switchyards
- Harmonics
- Home Appliances
- Power Supply testing
- Energy Star Testing

PUNE | AHMEDABAD | DELHI
CHENNAI | BANGALORE | MUMBAI

can be simply plugged in to charge the bag within four hours.

According to Kickstarter, on top of charging all your other gear, Phorce for Mac can also power a MacBook for up to seven extra hours. Thanks to its integrated lightweight battery pack, Phorce is powerful enough to charge an iPhone 5 over eight times, a Galaxy S3 about six times or an iPad Mini two-and-a-half times.

The bag is capable of charging three USB devices at a time. You can charge your smartphone, laptop, tablet, iPod, camera, smart watch, portable speaker and many more devices. The shape of the bag can be conveniently changed to a backpack, shoulder bag or suitcase as per your needs.

There is also an application developed by the team for Android and iOS, which keeps you informed about the power charge left in the bag and how you can use it. You can set a reminder to your bag, which tells you when the bag needs to be charged. There is also a security system in the bag that minimises the possibility of you losing it. You will receive an automatic SMS whenever the bag is out of range.

Make yourself Google Glasses

Wearable computers combine a pair of glasses with a wireless computing device. Basically, these are like a pilot's face mask. The interior of the glass acts like the display screen and the inputs might be taken by a blink of the eyes.

Google has designed a wearable computer on its Project Glass device, which is priced as high as \$1500. Linux

based mini computer Raspberry Pi comes to the rescue of those dreaming to own one. Using Raspberry Pi, you can create a similar device at less than one-third the price of Google Glass.

You need Vuzix Wrap 920 video glasses, a Raspberry Pi model B board, a few cables and wires, wireless adapters, SD card and, most importantly, a handful of powerful batteries. But the main problem is that you won't be able to see the outside world through the Vuzix LCD display glasses. So if you are cool with the idea of turning blind to the world to be a smart computing geek, you would find this project cheap and worthy.

The entire procedure is published at Instructables. The wearable computer takes its input through a wireless thumb keyboard, which comes with an integrated touchpad.

Most efficient solar cell

Sharp has achieved the world's highest solar cell conversion efficiency of 37.7 per cent by using a triple-junction compound solar cell in which three photo-absorption layers are stacked together.

The company achieved this breakthrough as the result of a solar cell R&D initiative promoted by Japan's New Energy and Industrial Technology Development Organization (NEDO).

Compound solar cells utilise photo-absorption layers made from compounds consisting of two or more elements, such as indium and gallium. The basic structure of this triple-junction compound solar cell uses proprietary Sharp technology that enables efficient stacking of the three photo-absorption layers, with InGaAs (indium gallium-arsenide) as the bottom layer.

To achieve this increase in conversion efficiency, Sharp made use of the ability of the new cell to efficiently absorb light from different wavelengths in sunlight and convert it into electricity. It also increased the active area for converting light into electricity through optimal processing of the cell edges.
