

NEW PRODUCTS

RECENTLY INTRODUCED IN INDIA, FROM NEAR AND FAR

COMPONENTS

Low-power comparators

STMicroelectronics has introduced a new generation of accurate, low-power components enabling improved energy efficiency and faster operation of equipment such as gas sensors, medical devices, safety systems and industrial controllers.

TS881 is the first in ST's new generation of comparators compatible with supply voltages as low as 1.1V over a wide temperature range, enabling longer operating times with smaller batteries. Suitable for use in front-end detection and measurement circuitry, TS881 is also said to be faster than competing devices, allowing a reduction in equipment response times.

Leveraging ST's innovations in analogue design, with very low operating current of 210 nA (typical at 25°C), TS881 is said to draw less than half the current of competing devices.

Single-chip video processors

NXP Semiconductors has introduced Advanced ASC884xA and ASC885xA series of single-chip video processors for HD IP security cameras. These devices integrate virtually all the functions required for an IP camera

design—from raw image sensor data input, image signal processing and H.264 compression, to secure encrypted transmission over the network through a Gigabit Ethernet interface.

Capturing as many as 60 frames per second at Full HD resolution (1080p/60), Advanced series supports H.264 high-profile encoding while consuming less than 1.5W of power. Further, ASC884xA and ASC885xA devices enable clear video images through advanced image signal processing features such as very flexible spatial and temporal (2D/3D) noise reduction for excellent low-light performance—critical for security cameras operating under a wide range of lighting conditions—as well as programmable edge enhancement.

High-voltage MOSFETs

High-end, AC-DC switch-mode power supply (SMPS) applications such as servers, telecom, computing and industrial power applications

require a high power density. To be successful, designers need cost-effective solutions that take up less board space and improve reliability. Fairchild Semiconductor helps designers address these challenges by introducing the 600V n-channel SuperFET II MOSFET series.

Offered in two product families—SuperFET II and SuperFET II Easy Drive—these MOSFETs offer a smaller stored energy in output capacitance for higher efficiency in light-load conditions and robust body diode for increased system reliability in resonant converters.

Utilising an advanced charge balance technology, these MOSFETs provide a low 'on'-resistance and a lower gate charge performance for a lower figure of merit.

Chip-on-board DC LED

Seoul Semiconductor has introduced a chip-on-board (COB) type DC LED series called ZC (Z-Power COB).

ZC series is based on Seoul's Z-Power LEDs that are mainly used as a source of high-brightness and high-power light. It decreases thermal resistance, resulting in an exponential improvement in life expectancy of the LED lighting product. It is possible to use a single ZC to develop an LED light bulb, which then allows light to be distributed more evenly than lights
