Miniature circuit breaker snap-in

Portex Technologies has introduced the Portex Precision circuit breaker, which is claimed to be India's first

miniature circuit breaker and a rocker-actuated on/off switch. It provides the dual benefits of operating it as a regular on/off switch as well as protection of an overload circuit breaker.

The device has a reliable over-current trip mechanism, actuated by a separate bimetallic heater system, housed in an insulated compartment. This design results in minimal heat loss and fast sensing of over-current, thereby ensuring rapid and accurate overload performance and complete safety during fault conditions.

XMC extension board

Kontron has released a dual-port, 10Gb XMC402 mezzanine card. OEMs and system operators can leverage this card to upgrade their communication structures quickly and cost-efficiently to 10Gb bandwidth.

XMC402 features the 10Gb Intel

that connect several LED packages to a single module.

ZC is offered in 6W, 10W and 16W ratings, which are appropriate replacements for 40W and 60W incandescent light bulbs and 100W down lights, respectively.

28nm heterogeneous knowledge-based processors

Broadcom has started sampling NLA12000 Series, claimed to be the industry's first heterogeneous knowledge-based processors (KBPs) manufactured in 28nm process.

Designed to meet the scalability and efficiency demands of 3G/4G mobile infrastructure, data centre and enterprise environments, these processors are said to deliver up to 24 times greater performance than competing solutions in the most demanding applications. They are optimised for deployment in routers, switches, service gateways, security appliances and mobile infrastructure equipment.

The processors are said to be the industry's first to integrate an eighth-generation massively parallel knowledge-based processing technology with low-power NetRoute algorithmic search technology in a heterogeneous manner.

Secure chipset

Maxim Integrated Products has introduced a chipset that is said to provide the strongest levels of security

when authentication of peripherals is necessary. As part of Maxim's Deep-Cover security products, the chipset comprises DS2465 secure coprocessor with integrated 1-wire master and DS28E15/DS28E22/DS28E25 1-wire secure authenticators.

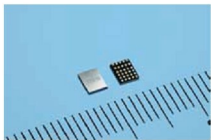

The chipset protects a revenue stream by ensuring that only licensed peripherals are used with OEM equipment. Many applications in consumer, medical, industrial and communications markets will immediately benefit from this security.

DS2465 coprocessor, used with any of the 1-wire secure authenticators, identifies unlicensed after-market peripherals that are not approved for a system.

Point-of-load converter ICs

Renesas Electronics has introduced RAA20770X series mini point-of-load (POL) converters for ASICs and other large-scale logic circuits in a variety of application fields including personal

computers, servers, and industrial, office automation and networking equipment. RAA20770X Series devices are said to achieve the industry's highest level of miniaturisation and power density. Renesas is releasing six products with different current supply ratings and functionality.

While the sample price for these products will differ depending on the output capacity, the sample price for RAA207700GBM with a maximum rated current of 15A is \$2.05 per unit.
