

Programming Arduino: Getting Started with Sketches

With a little electronics you can make your Arduino board do many things, from controlling lights in an art installation to managing the power on a solar energy system. This book makes programming the Arduino board simple and enjoyable, avoiding the difficulties of uncooperative code that so often afflict a project. It details the process of programming the Arduino step by step, starting with the basics of 'C' programming language that Arduinos use.

Using clear, easy-to-follow examples, the book reveals the software side of Arduino and explains how to write well-crafted sketches using the modified 'C' language of Arduino. No prior experience in programming is required. The downloadable sample programs featured in the book can be used as-is or modified to suit your purposes.

Speech and Audio Processing

Written for the undergraduate and postgraduate students in ECE, CS and IT streams, this book aims at explaining the basic concepts in a clear-cut and simplified manner. It begins with the human speech production mechanism and then goes on to explain the fundamental parameters of speech such as pitch frequency, formants, spectral features like log spectrum, 3D spectrogram, cepstral features, MFCC, linear prediction coefficients, transform-domain parameters and template matching techniques.

The book details all the features used for speech recognition, speaker recognition and speech synthesis with practical experiments designed using MATLAB. It also includes the techniques used for musical signal synthesis and musical instrument recognition in polyphonic music.

The accompanying CD contains MATLAB programs, input sound files and colour pictures of important figures.

Creating Embedded Systems Using Renesas RL78 Family Microcontrollers

Useful for practicing engineers as well as university students, this book shows how to design and optimise embedded systems using the energy-efficient RL78 family of microcontrollers from Renesas Electronics Inc. The authors have masterfully applied RL78 capabilities to real-world challenges using examples and applications.

Topics covered are introduction to embedded systems, microcontroller concepts, infrastructure and interfacing, RL78 CPU core and interrupts, software engineering for embedded systems, software development tools, 'C' as implemented in Assembly language, converting from the analogue to the digital domain, serial communications, timer peripherals, peripherals for robustness and performance, designing responsive and real-time systems, optimising for program speed, and power and energy optimisation.
