Submersible pump controller

ICON Electronic Systems has developed a feature-rich, cost-effective electronic digital motor controller for submersible pump. The IDMI3x1 has digital meters with class 1.0 accuracy for amps, volts

and pump status on a 4-digit, 7-segment display. It is protected against overload, dry-run, over-voltage and under-voltage, with user-selectable (digitally) limits for overload and dry-run currents.

Maximum and minimum current values are recorded for analysing the motor's performance. Various models suitable for submersible pumps up to 2 HP are available in compact sizes.

CONNECTORS

Routing terminals

Phoenix Contact has introduced plugable, four-level routing terminals called PT 2.5-4L/1P and PT 2.5-4L/2P. These terminals provide universal

signal distribution options within compact control systems and plant sections.

The terminals offer various bridging options within the terminal strip, as well as routing options within the freely configurable four-position connector. This allows creation of compact, three-dimensional signal distributors using the terminal system.

The terminal version with two slots increases the system modularity with an additional signal routing level within the routing connectors that can be individually configured.

LIGHTING

High-intensity aviation light

Binay Opto Electronics has introduced a flashing-white, high-intensity, PowerLED aviation obstruction light. The HIA-DX-200KCD-W meets the International Civil Aviation Organisation (ICAO) and US Federal Aviation Administration (FAA) Type L-856 requirements for luminous intensity of 200,000 candela ± 25 per cent in flashing white mode of 20-60 flashes per minute.

The body and base are made with LM-6 aluminium-silicon alloy. The top cover acts as a heat-sink to enhance LED life and reliability. Compared to conventional xenon-based lights, the HIA-DX-200KCD-W has a long life of 100,000 hours (to L50), thus enabling a

minimum life of ten years. It can withstand a wide variation in the input voltage from 100V to 260V.

MISCELLANEOUS

Fingerprint scanner

BioEnable Technologies has launched an upgraded version of the Fingkey Hamster DX.

The new version, called the Fingkey Hamster III, uses cutting-edge technology to prevent the use of fake fingerprints. It can be connected to a PC along with a normal mouse and used for all the areas involving passwords. Dry finger detection is one of the major upgrades that have been added to its design.

M2M connector software

The iDigi Device Cloud from Digi International is driving the Internet of anything by connecting M2M devices everywhere. With the free iDigi Connector software download, any M2M device can be integrated with the iDigi Device Cloud.

Featuring a small memory footprint, the software supports any device operating platform. It facilitates two-way messaging for full cloud-to-device messaging and control. The software is said to enable effective device management and application development (including firmware updates, configuration viewing and device reboot).

The iDigi Connector software is available for free download at www.idigi.com/efy
