

BINAY – Lighting Up The Future

Binay LED Aviation Obstruction Lights

**BINAY LED-based MEDIUM INTENSITY
Aviation Obstruction Light Beacon**

As per the International Civil Aviation Organisation (ICAO) requirements for use on structures above 45m

Available in Low Intensity and Medium Intensity versions (as per the International Civil Aviation Organization guidelines). BINAY's patented LED Aviation Lights come with a 5-year warranty

LED Obstruction Lighting for:

- Industrial chimneys and smokestacks
- Transmission, microwave, and cellular towers
- Radio, TV and similar structural towers
- High-rise buildings and structures
- Airports and airfields

The BINAY LED Aviation Obstruction Light offers the following advantages:

- Fit-and-forget maintenance-free operation
- A long life of 100,000 hours (20 years at 12 hours daily burning)
- Pays for itself within a short period of operation in the form of reduced installation, maintenance and servicing costs
- Quick installation; Reliable operation 365 days per year
- Shock-proof and vibration-resistant
- Over-Designed Intensity to allow for natural LED intensity degradation over its operating lifetime

**THE BINAY LED OBSTRUCTION LIGHT IS UNDER ACCEPTED
PATENT, AND AS SUCH IS A PROPRIETARY PRODUCT**

Geiger counter. It developed this phone after the nuclear disaster in Fukushima, which raised serious concerns regarding harmful radiation levels in Japan. The radiation detector in the phone is user-friendly and capable of measuring radiation levels with 20 per cent accuracy. The phone runs Android 4.0 OS and has a 9.4cm (3.7-inch) LCD screen and a 4-megapixel camera.

According to a Wired report, this is not the first smartphone with Geiger count but definitely the first with radiation detector. To turn the radiation sensor 'on,' one just needs to press a button below the screen. The phone is expected to release around July-end.

12.7cm display with full HD resolution

LG has developed a 12.7cm (5-inch), full HD LCD panel, which is being touted as the highest-resolution panel till date. This will bring about a revolution by offering smartphone users full HD content of the same quality as on TVs and monitors.

The new panel is expected to enhance the cloud computing experience. It is based on the advanced high-performance in-plane switching (AH-IPS) technology, which allows 440ppi pixel density and 1920x1080 resolution. With 16:9 wide-screen aspect ratio, the panel is also 1.3 cm larger, 2.2 times denser in pixels and 1.3 times more advanced in ppi than the preceding 11.4cm (4.5-inch) panel at 329 ppi and 1280x720.

Commenting on the launch, Sang-Deok Yeo, CTO and executive vice president, LG Display, said, "As smartphones become increasingly valued for how well they do multimedia and with the rapid growth of LTE enabling faster large file transfers, our new panel is certain to prove a significant asset to the mobile market."

US Army research engineers boost battery life by 30 per cent

To make things easier for their soldiers, the US Army research engineers have developed some new materials that could potentially increase the energy density of batteries by 30 per cent.

This group of scientists has been studying batteries for many years now. "This 30 per cent is actually quite a big deal. Typically, improvements range about one per cent a year with a few step changes," said Cynthia Lundgren, electrochemical branch chief, US Army Research Laboratory.

"There has never been a battery, a single cell, that operated at five volts. Through our understanding of that interface, we were able to design an additive that you add into the electrolyte which is somewhat of a sacrificial agent. It preferentially reacts with the electrode and forms a stable interface. Now the battery is able to operate at five volts," Lundgren explained.

Noise-cancelling PC fan

Unless you have a fanless setup, your PC is going to produce some kind of noise from the fans spinning inside. Well, an Austrian manufacturer called Noctua is all set to introduce
