

Marvell's 802.11ac-enabled chip that combines NFC and bluetooth

biological systems, understand how the cosmos evolved after the Big Bang, design new materials at the atomic level, predict the behaviour of hurricanes and tornadoes, and simulate complex engineered systems like the power distribution system and airplanes and automobiles.

With 380,000 AMD Opteron 6200 Series x86 processors (and 3000 NVIDIA GPUs), the cluster will use 40Gbps Ethernet technology with aggregate

ComputerWorld reported.

The company supplying tape drives, Spectra Logic, feels that Blue Waters will take a couple of years to scale up to 380 petabytes and eventually become one of the world's largest active file repositories stored on tape media.

All-in-one chip for mobile devices

A new 802.11ac-enabled chip from

Marvell's chip, called the Avastar 88W8897, is slightly different from Broadcom's own chipsets which are already being sold since the beginning of 2012. While Broadcom's 802.11ac chips are made for routers, the Avastar 88W8897 is primarily geared at mobile devices.

According to Marvell, its 802.11ac chip will be embedded inside larger devices, including ultrabooks and tablets.

As the Avastar 88W8897 combines 802.11ac, NFC and Bluetooth in one die, it is said to offer more options for mobile devices. Also, it offers 802.11ac in dual-stream configuration only, meaning the Wi-Fi bandwidth peaks at around 900 Mbps.

Marvell claims that its chip is physically up to 50 per cent smaller than rival chip combinations that offer the same functions and also costs up to 75 per cent less than previous wireless chips. The chip is designed to support Wi-Fi-Certified Miracast.

LPU students design driverless car

Students of Lovely Professional University (LPU), Punjab, have built a driverless car, which can be controlled by a mobile phone from any part of the world. The car can monitor its surroundings on real-time basis, thanks to two Internet protocol (IP) wireless cameras—one each on front and rear side. The car has been successfully tested for over 1000 km.

The car is pliable in both the auto and manual modes. It includes safety provisions such as child-lock system while in auto mode. Anyone sitting at the pillion seat can also drive on his own on asking the driver having an access to the remote-seated operator. The car can be commanded even during night, according to the students.

The car has been designed by five students of electronics and communication and mechanical engineering under the guidance of their mentors. The team included Bikas, Lokesh Ramina, Rahul Jain, Suvendu and Barkha Prasad.

Driverless car developed by LPU students

throughput of up to a terabyte per second. The primary interconnect, however, is Cray's Gemini technology,

Marvell includes Near Field Communication (NFC) and Bluetooth, to offer a complete mobile wireless package.
