

majority of smartphones available in the market are powered by single-core processors with dual-core ones slowly picking up pace.

If you plan to add an equal mix of productivity tasks and HD gaming and video viewing to your smartphone, go for a smartphone with a dual-core processor to maximise the performance and experience. For basic multi-tasking between apps, playing lighter games and accessing Internet applications, a single-core processor will suffice.

Form factor

Touch screens might be the in-thing these days but a few manufacturers are also offering smartphones in QWERTY, touch-and-type and slider form factors. A sub-10cm touch screen is what you will find in majority of the smartphones. A screen larger than this looks fabulous and makes videos clearer and easier to watch, but it can give you a 'brick like' feeling in your hands. Business users would surely

Nokia 603 smartphone

like to opt for QWERTY smartphones, as these are convenient for texting e-mails and messages.

Operating system

Android from Google has become the reigning operating system (OS) in terms of popularity. It offers a comfortable mobile experience. Not only does the user get access to hundreds and thousands of apps but the OS also gives you the choice between many mobile phone makers.

But then, there is Symbian that was earlier enjoying the top spot until Android and Apple's iOS came into the picture. Symbian is another easy-to-operate OS that you would find in almost all Nokia handsets.

Despite a feeble response from the consumers, the Windows Phone OS too is gaining pace as many smartphone makers are showing interest in it. But beware, do not expect the desktop-like experience from Windows Phone OS based smartphones.

Then there is the BlackBerry OS that powers the BlackBerry handsets. Unlike other OS, BlackBerry offers a very small apps collection.
