

An Embedded Software Primer

This book helps beginners learn the basic principles of writing software for embedded systems. Across its eleven chapters, it surveys the issues and discusses various techniques to deal with them.

The book covers embedded system and hardware fundamentals, interrupts, software architectures, introduction to real-time operating systems (RTOS), operating system services, basic design using an RTOS, embedded software development tools and debugging techniques.

The accompanying DVD contains answers to select problems in the book, and all of the files you need to build the underground tank monitoring system discussed in the book.

SPICE (Second Edition)

This book outlines how Simulation Program with Integrated Circuit Emphasis (SPICE) is used in the process of design. Across its 14 chapters, it covers methodologies for analysing transistor and op-amp circuits, over a hundred SPICE examples and several in-depth exercise problem sets to be solved using Spice.

The book can be used as a manual for computer-aided analysis of microelectronic circuits. Though intended for undergraduate students learning microelectronics for the first time, it can also serve as a tutorial to many industry professionals. Most circuits in the book can be simulated using a student version of PSpice.

MSP430 Microcontroller in Embedded System Projects

This book is a compendium of 24 innovative embedded systems projects carried out in Indian universities. These projects are chosen from the domains of assistive technologies for the disabled, renewable energy, safety and security, emergency care and health monitoring, and automotive electronics. Each project carries a block diagram, hardware and software organisation, experimental results and references. An entire section is devoted to the architectural overview of the MSP430 family of microcontrollers and development tools for the MSP430 platform.

Some of the projects included in the book are position location and navigation aid for the blind, tilt-based wheelchair movement and health monitoring system for quadriplegic patients, life-saving low-cost integrated wireless health monitoring system with emergency response, wireless ambulatory blood pressure monitoring system, LED technology based low-cost electronic security, anti-collision system that works in rain along with wiper speed control, solar photovoltaic emulator and remote power theft monitoring system.
