

General purpose PIC® microcontrollers with advanced peripheral integration

Increased intelligence and reduced system costs

Microchip's new 8-bit microcontrollers (MCUs) feature next-generation analogue and digital peripherals, making them ideal for battery charging, LED lighting, ballast-control, power-conversion and system-control applications. The PIC12F752 and high-voltage PIC12HV752 enable engineers to increase overall system capabilities while reducing costs.

The PIC12F(HV)752's integrated Complementary Output Generator (COG) peripheral delivers non-overlapping, complementary waveforms for inputs such as comparators, Pulse Width Modulation (PWM) and other peripherals. This powerful COG also gives you dead-band control, auto shutdown, auto reset, phase control and blanking control.

Other capability-boosting features include 1.75 KB of self read-write programme memory and 64 B of RAM, plus an on-chip 10-bit ADC, Capture-Compare PWM modules, high-performance comparators with response times down to 40 ns, 50 mA outputs for direct FET drive and two 50 mA-capable I/Os. There is also a 4-channel, 10-bit ADC to add sensing functions including mTouch™ capacitive touch sensing, and an on-board shunt regulator on the high-voltage PIC12HV752.

GET STARTED IN 3 EASY STEPS:

1. Select the PIC12F752 or high-voltage PIC12HV752
2. Choose from 3 low-cost debugger/programmers
3. Start increasing system performance and reducing system cost
