COMPONENTS

Digital power controller

Texas Instruments has introduced a digital power management controller for AC-DC and isolated DC-DC power supply applications.

The UCD3138 features sync-FET soft on-off control, dynamic phase shedding, dynamic frequency adjustment and dynamic mode switching. It supports single-phase, two-phase interleaved or bridgeless power factor correction, hard-switching full-bridge, phase-shifted full-bridge and other topologies. The device implements peak-current mode control, cycle-by-cycle peak-current limiting, high-speed input voltage feed-forward, and over-voltage, over-current and over-temperature protection.

Current-mode controller

ON Semiconductor has introduced a fixed-frequency current-mode controller that features integrated X2 capacitor discharge circuitry, which eliminates the need for X2 capacitor discharge resistors.

The NCP1246 enters a low-consumption sleep mode when used in conjunction with NCP4353 or NCP4354 secondary-side switch-mode power

supply controllers. These devices detect no-load conditions and signal the power supply to enter a low-consumption 'off' mode. Integrated features include constant-voltage and constant-current regulation as well as optional built-in LED driver for adaptor indicator light.

Voltage-level translator

STMicroelectronics has introduced a voltage-level translator compliant with Secure Digital (SD) 13.0 standard. The ST6G3244 couples high-speed operation with very low power dissipation, supported with the power-down mode. Data integrity is

secured through propagation delays, electromagnetic-interference filters and signal conditioning.

The translator incorporates 15kV air-gap electrostatic discharge protection on the card side. The selectable-supply (1.8V or 2.9V), 6-bit bidirectional CMOS-level translator for SD, mini-SD and micro-SD memory card is offered in BGA25 package.

Low-loss SiC power devices

Renesas Electronics Corporation has launched three silicon-carbide (SiC)

power devices with voltage tolerance of 600V.

The RJQ6020DPM device for critical-conduction-mode power factor correction (PFC) applications combines in a single package an SiC-Schottky barrier diode (SBD) and two high-

voltage power MOSFETs. The reverse recovery time of SiC-SBD is 15 nanoseconds. The RJQ6021DPM device for continuous-conduction-mode PFC applications combines in a single package an SiC-SBD and two insulated-gate bipolar transistors. The RJQ6022DPM device for inverter half-bridge circuits combines in a single package two SiC-SBDs and two IGBTs.

TEST & MEASUREMENT

Burst generator

Scientific Mes Technik has added burst generators from Schloder, GmbH to its product family. SFT 1400

and SFT 1420 are available in 125kHz and 2000kHz frequency range, respectively.
