

Open Source Computing Platforms

Here is a collection of Open Source hardware websites that help you get started with powerful application development. Find interesting do-it-yourself projects, engage in discussions with community experts and source technical material

BeagleBone

BeagleBone is a low-cost credit-card-sized Linux computer that connects with the Internet and runs software such as Android 4.0 and Ubuntu. With plenty of inputs/outputs and processing power for real-time analysis provided by Texas Instruments' Sitara AM335x ARM Cortex-A8 processor, it can be complemented with cape plug-in boards to augment its functionality. The site has all the details about BeagleBone. It has a discussion board along with links that provide information on where you can buy the board.

BeagleBoard

BeagleBoard is a low-power, low-cost, fanless single-board computer based on Texas Instruments processors featuring the ARM Cortex-A series core. It was designed as a way of demonstrating the Texas Instruments' OMAP3530 system-on-a-chip. BeagleBoard.org is an all-volunteer activity started up by a group of passionate individuals, including several employees of Texas Instruments, interested in creating powerful, Open and embedded devices. The site has a discussion board along with links that provide information on where you can buy the board. It also refers to around two hundred different projects related to the board.

PandaBoard

PandaBoard is a low-cost, low-power, single-board computer based on Texas Instruments' OMAP4430 processor. www.pandaboard.org is an online resource and collaboration site for the growing, active community supporting PandaBoard. The site is a useful resource for mobile application developers designing on Linux-based distributions. It provides developers an opportunity to engage with community experts and source technical material. The site is managed by volunteers who are committed to Open Source development.

Arduino

Arduino is an Open Source physical computing platform based on a simple microcontroller board. The Playground is a wiki where all the users of Arduino can contribute and benefit from their collective research. The Arduino official site has a section where you can find a list of Arduino-based do-it-yourself project ideas. The list is helpful for both the novice and the experienced. The project ideas have been divided into three categories—easy, intermediate and advanced—for easy navigation.

CuBox

CuBox is a little computer that can be used for various purposes. Consuming less than 3 watts, weighing 91 grams and measuring roughly 5.1×5.1×5.1 cm³, the computer is designed as an Open Source development platform. You can use CuBox to create your own media center, thin client, XBMC console, network-attached storage device or anything else you want. The site offers all documentation and project ideas related to CuBox.
