RECENTLY INTRODUCED IN INDIA, FROM NEAR AND FAR

COMPONENTS

High-resolution signal processor

iC-Haus GmbH, Germany, has introduced a high-resolution signal processor that is capable of evaluating sine/cosine sensors and minimising angular errors and jitters with automatic functions. The iC-TW8 processor could also be utilised for initial push-button calibration and permanently adapting signal path parameters during operation.

Its angular position is calculated at a programmable resolution of up to 65,536 increments per input cycle and output as an indexed incremental signal. A 32-bit word including the counted cycles is available through the SPI.

As an application-specific DSP, iC-TW8 has two analogue/digital converters that sample simultaneously at a rate of 250 kSa/s, fast CORDIC algorithms and special signal filters, and an analogue front-end with differential PGA inputs that accepts typical magnetic sensor signals from 20 mVpp upwards.

Imaging/video DSP IP core

Tensilica, Inc. has introduced an imaging and video dataplane processor that is ideal for complex image/video

signal processing functions in mobile handsets, tablets, digital televisions, automobiles, video games and computer vision based applications.

The IVP is supported by a network of third-party application developers who actively port leading-edge image applications to the IVP platform. These applications include innovative multi-frame image capture and video pre- and post-processing algorithms, as well as established yet evolving technologies such as video stabilisation, high dynamic range (HDR) image, video HDR, object and face recognition and tracking, low-light image enhancement, digital zoom and gesture recognition.

The IVP is capable of over 130 billion 16-bit RISC-equivalent operations per second.

Foil resistors

Integrated Electronics Technology (INTRON) has introduced foil resistors from Vishay Precision Group.

These foil resistors provide extremely low temperature coefficient of resistance (TCR) of 0.05 ppm/°C typical (0°C to +60°C), long-term stability to ± 0.0025 per cent at 70°C and 2000 hours at rated power, and electrostatic discharge (ESD) protection to at least 25 kV.

These characteristics allow designers to reduce circuit errors significantly and improve overall performance in applications requiring a high degree of precision and stability.

These resistors find application in weighing scales, medical testing equipment, semiconductor equipment, precision measuring instruments, etc.

Power MOSFETs for hot-swap applications

NXP Semiconductors has launched NextPower Live family of linear-mode power MOSFETs for use in 'hot-swap' environments.

The NextPower Live family offers a very low RDS(on) value. It incorporates 30V devices for applications such as blade servers operating on a 12V DC supply and 100V devices for telecommunications applications operating on a nominal 48V DC supply. Both voltage options come in D2PAK and LFPACK56 (Power-SO8 compatible) packages.

Battery fuel-gauging IC

Battery charge indicators—or fuel gauges—have become essential for managing devices such as smartphones, laptops and digital cameras. STMicroelectronics has introduced a battery fuel-gauging chip that can be used in high-volume handheld electronics, and has already been selected by Samsung for some of its recent smartphones.
