

Until now, leading devices have used Coulomb counting to monitor energy entering and leaving the battery, and periodic voltage-mode state-of-charge measurements to adjust the Coulomb counter for accuracy. The STC3115 uses both sets of measurements continuously with OptimGauge—an adaptive algorithm that tracks the state of charge and corrects the battery model.

The STC3115 further enhances accuracy by measuring true initial battery open-circuit voltage and preventing measurement disruptions when connecting the charger or launching an app.

Shorted-anode IGBTs

High-power and high-frequency induction heating (IH) appliances, such as table-top induction cookers and inverter-based microwave ovens, require lower conduction losses and superior switching performance in order to achieve higher efficiency and system reliability. Fairchild Semiconductor's high-voltage, field-stop, shorted-anode trench IGBTs provide designers with a highly efficient, cost-effective solution to these design challenges.

Ranging from 1100V to 1400V, these IGBTs are optimised with intrinsic anti-parallel diodes for soft switching applications. With

advancements over the typical non-punch-through (NPT) IGBT technology, Fairchild's shorted-anode silicon technology offers a lower saturation voltage of over 12 per cent less than the same-rating NPT-trench IGBT.

High-speed synchronous rectifier controller

International Rectifier (IR) has expanded its SmartRectifier IC family with the introduction of IR1169 high-speed synchronous rectifier (SR) controller for flyback, forward and half-bridge converters used in AC-DC adaptors, PCs, servers and telecom SMPS applications.

The IR1169 features a SYNC function that turns off the SR MOSFET to prevent reverse current flow under continuous conduction mode operation, thereby improving functionality and reliability. Unlike existing solutions, the advanced new device uses direct sensing with capacitor coupling to help simplify design and reduce overall system cost.

Featuring IR's proprietary 200V high-voltage IC technology, the IR1169 supports burst mode operation to deliver efficiency benefits even at light loads.

TOOLS & EQUIPMENT

Lacing machine

Electromech has launched Trimfit 100 coil-binding machine for use in motor manufacturing lines. The machine is equipped with a servo in combination with programmable logic controller, which enhances the adaptability of the machine to cover a wide range of motors and alternators.

Changeover from 2-pole to 4-pole, or alternate coil to continuous coil binding is just a choice of the program. Small footprint of the machine enables flexible production line configuration and efficient utilisation of production floor.

Processor board

Emerson Network Power has launched a 3U OpenVPX processor board that provides a high compute performance, flexibility, and high-speed fabric connectivity to a range of industrial, communication and military/aerospace applications.

The iVPX7225 is based on the dual-core third-generation Intel Core i7 2.5GHz processor, featuring the
